

Analytic and numerical modeling of solar-wind turbulence

S. Boldyrev

Department of Physics, University of Wisconsin, Madison, United States (boldyrev@wisc.edu)

The talk will discuss recent developments in the theory and modeling of magnetic plasma turbulence, and their applications to the solar-wind. It will address the role of the large-scale magnetic field, the anisotropies of the turbulent energy cascade, the phenomenon of Alfvénization, and the processes of self-organization and structure formation at large and small scales."
