

www.PEP725.eu - the Pan European Phenology database

E. Koch, W. Lipa, and M. Ungersböck

Central Institute for Meteorology and Geodynamics, Climatology, Vienna, Austria (e.koch@zamg.ac.at)

PEP725 promotes and facilitates phenological research by delivering a pan European phenological database with an open, unrestricted data access for science, research and education. So far 16 European meteorological services and 7 partners from different national phenological network operators have joined PEP725.

The data access is very easy via web-access from the homepage www.pep725.eu. Having accepted the PEP725 data policy and registry the data download is quick and easy and can be down by different criteria as for instance the selection of a specific plant or all data from one country. We have observations of 31 European countries in the PEP725 database that is in total data from 8150 stations. For more than 154 stations at least META data (location and data holder) are provided. Links to the network operators and data owners are also on the webpage in case you have more sophisticated questions about the data. Another objective of PEP725 is to bring together network-operators and scientists by organizing workshops.

PEP725 a project funded by ZAMG, the Austrian ministry for science & research bm:w_f and EUMETNET (the network of European meteorological services), ZAMG and is running for 5 years 2010-2014.
