

## **Water management of Luanda region. A health and environmental characterization.**

C. Neto Santos

Science Faculty of Agostinho Neto University, Biology, Luanda, Angola (camyvandunem@gmail.com, 00244 222336168)

The river system in the Luanda region is made by the Cuanza River in the south and the northern with Bengo River. The water resources are abundant and seem to be an advantage in the development of the city, at a time when access to water is very critical as in the African continent. A sharing of angles, both the Men and animals use the flows of rivers together. After all that there is availability of water for the city's population, given the large number of other animal species also depend directly or indirectly these rivers. In order to contribute to the knowledge of this resource in the region, we want to characterize a health and environmental point of this river system of Luanda, Angola.
