The region that we are studying about it is situated in 32.25-34.7° latitude and 48.6-50.45° longitude. This zone is a part of seismotectonic province, Central Iran and Zagros.

Zagros seismotectonic is one of the seismicity regions in Iran. While in the Central Iran seismotectonic occur less earthquakes in relation to another region of Iran but because of situating in Arabia-Eurasia plate convergence zone has high seismicity potential.

In this study, we are going to survey seismotectonic of region that is include of fault maps, seismotectonic and fault segments.
