

## **Applied climate science: the risk management route**

stephan harrison

Exeter University, United Kingdom (stephan.harrison@exeter.ac.uk)

While several Masters programmes on climate science exist in the British Isles, until recently there has been little regard for the requirements of business, local government and the insurance market in the provision of postgraduate taught programmes. This talk will discuss the issue of climate change risk management as a way of embedding climate science into the decision-making protocols for commercial and governmental organisations. It will outline several issues for business decision-making that have implications for climate change. These include: climate sensitivity, model uncertainty and rapid climate change. The experience of developing and running the MSc in Climate Change and Risk management at Exeter University will be used to highlight these issues.
