Developed in Kiev Main Astronomical Observatory in the middle of
1980s software for processing of satellite laser ranging data
was totally redesinged and rewritten in C++. Now it owns new features
for fast processing of different king of SLR observations.
It implements the newest IERS standards and may be very easily switched
to different kind of force and transformation models.
We presend our first results in processing of multiple satellite SLR
observations together and results of joint processing of Glonass
SLR/GNSS observations.
