We present a~descriptive overview of the meteorology in the south eastern Subtropical Pacific during the VOCALS-REx intensive observations campaign, which took place in October and November 2008. We provide a~summary of the day-to-day meteorological and cloud conditions. Our main aim is to link the large-scale conditions of the atmospheric circulation with the locally observed conditions, also with a~view of estimating the representativity of the specific season that was sampled by VOCALS-REx.
