Università per Stranieri, Perugia, Italy (alessandro.letto@hotmail.com)

The understanding of sustainable development within the mainframe of international relations, impose a serious approach to the differences in the access to water in various contexts. Starting from the traditionalist and behaviourist approaches to the field of Sustainable Development, we discover the importance of the access to water as one of the major challenge of humanity in this century. Not only for the related environmental issues, but at political and economic level too.

The inter-disciplinary nature of the field requires a new approach to understand how the politics of water affect politics and vice versa, including the influence of environmental major issues. The future scenario will be a brand new mix of balance power between the top down decision of the government and the bottom up experience impose by the common people, that today learn more and more how to take care of its interests. Nevertheless, it is of paramount importance support under the scientific point of view a campaign of information in favour of the common people, in order to increase that needed awareness able to deeply comprehend the impact of wrong environmental policies on our daily life, especially in the prevention of those risks generated by water scarcity and by water related natural disaster.
