

Stochastic resonance in multistable systems

Catherine Nicolis

Institut Royal Météorologique de Belgique 3, Av. Circulaire 1180 Brussels, Belgium

The classical setting of stochastic resonance is extended to account for the presence of an arbitrary number of simultaneously stable states. General expressions for the linear response are derived for systems involving one variable. The existence of an optimal value of noise strength and of an optimal number of intermediate stable states for which the response is maximized is established.
