The Trans-African Hydro-Meteorological Observatory ([www.tahmo.org](http://www.tahmo.org)) is an initiative to develop, deploy, and operate 20,000 measurement stations in sub-Saharan Africa. Until recently, the activities have been limited but the project is now moving ahead and has developed activities in Zambia and Ghana. Design, Education, and Operation are the three main lines along which the initiative has been developing. Design follows a set of rules that serve easy deployment and operation, such as absence of moving parts and cavities, self- and cross calibration of sensors, and low cost (€ 200-300 per station). Education is central to the success of the project. The idea is that stations will be deployed at high schools and that educational material will be developed for the science curriculum. This approach will ensure good social embedding and acceptance as well as help create a generation of scientists and technicians with hands-on environmental monitoring experience. Operation focuses on the long-term financial sustainability of the network. Raw data will be made available for scientific use but value added products will be produced to finance maintenance and operation. The main purposes of the presentation are to provide details on recent developments, broaden the number of institutes involved and, especially, open discussion on further development of the initiative.
