The age-span of the new species *fossulata* of the genus *Nummulites* which was originally found in Afghanistan by de Cizancourt (1938, 1946) is Late Cuisian to Earliest Lutetian range.

In this study *Nummulites fossulata* de Cizancourt was found in the samples from the Safranbolu Formation (Safranbolu Basin) which is Lower-Middle Eocene aged and Yıldıztepe Formation (Malatya Basin) which is Middle Eocene aged.

*Nummulites fossulata* de Cizancourt is reported for the first time from the Safranbolu Basin (Karabük, NW Turkey) and Malatya Basin (Malatya, E Turkey), and its global distribution is discussed in relation to climate, temperature and salinity conditions.
