

BUFR and GRIB file formats considered harmful for data archiving

John Caron and Jennifer Oxelson

Unidata / University Corporation for Atmospheric Research

The WMO-mandated BUFR and GRIB file formats are not suitable for data archival, due to inconsistent handling of the external tables on which the correct reading of those formats depends.

We present a partial solution to this problem, namely a web-based registry of authoritative tables, and a proposal to embed MD5 checksums in the GRIB and BUFR records. A prototype implementation will be demonstrated.
