

Climate Change in an IB PYP Classroom

Ana da Costa

Austria (a.costa@isc.ac.at)

Students in elementary school are inherently curious, which allows them to explore, experiment and investigate various themes, while also demonstrating the will to preserve the resources that surround them and take action to contribute to a better world. One of the units taught at International School Carinthia is "climate change" and its impacts on life on Earth. During this unit, grade 4 students conduct research to answer their own inquiries related to this topic. They investigate the different climate zones on our planet, examine why climate change happens, and discover how global warming and climate change are connected and its consequences on living beings.
