

Geotourism as a tool for secondary school education.

Malgorzata Mordal

University of Warsaw, Warsaw, Poland, (malgorzatamordal@o2.pl)

Geotourism, as a new scientific discipline is becoming more and more popular. At the same time, geological issues are the most difficult material to master in secondary school. The logical consequence seems to be the combination of the two issues mentioned above and the use of geotourism as a tool in teaching inanimate nature, in particular issues in geomorphology and geology.

The purpose of this poster is to present:

- the analysis of difficulties of questions at Matura (A-level equivalent) related to issues in geology and geomorphology, as a justification for reaching for the geotourism, as a form of remedy,
- selected sites (geosites) of an outstanding educational character, which were designed as a result of field research, conducted in summer 2013 in Polish coastal national parks,
- proposals of using geosites for field's workshops and educational games.
