Preliminary Results from CONTRAST

Ross J. Salawitch, Laura Pan, Elliot Atlas, and the CONTRAST Sciene Team University of Maryland, College Park, United States (rjs@atmos.umd.edu)

The CONvective TRansport of Active Species in the Tropics (CONTRAST) experiment is designed to quantify how convection redistributes atmospheric gases in the tropical atmosphere. Observations will be obtained by the NSF/NCAR HIAPER aircraft from a series of flights in Guam during January and February 2014. We will describe preliminary results from the CONTRAST experiment.
