

Learning about geological events in Vendée (west coast of France)

Florence Bretaudeau and Bruno Lavigne

Ensemble scolaire Sainte Marie Bastide, Bordeaux, France

Our 70 pupils, aged from 17 to 18 had discovered an area of the west coast of France : Vendée. We studied rocks in order to tell the geological story of this area.

Several characteristics were looked at : sedimentary and metamorphics rocks, minerals, fault, folding, unconformability...

We took advantage of this geological journey to look at biodiversity in different ecosystems : rocky coast, dune, wood.
