## Potentials of complex network analysis of regional rainfall variability

Norbert Marwan

Potsdam Institute for Climate Impact Research, Transdisciplinary Concepts and Methods, Potsdam, Germany (marwan@pik-potsdam.de)

Regional variability of extreme precipitation is characterised by distinctive patterns of statistical interrelations. The propagation, structure, and complexity of such patterns can be studied by means of complex network theory. We demonstrate the potential of this analytical framework for identification of teleconnections, propagation patterns, or finding prediction schemes for extreme rainfall.
