Geoethics, is a new term that could be unknown in the Arab world, where its translation in Arabic language make some kind of problems, with special emphasis on Egypt; spreading this term and the importance of it to professionals and un professionals is not an easy task. Culture and awareness problems face us on dealing with it.

In this working paper the researchers study two levels of educational samples, the first one is of young geo-scientists and the other one is of young people of different disciplines to make over view survey (monitoring the base level) about knowing geoethics and another survey after applying some lectures and workshops to the same samples to monitor the second level.

The aim of the research is to find out how people will accept this term and its application and how we can spread it through community with different effective ways.

In Egypt there are some kind of culture problems could affect on spreading of any new concept, these problems could be overcome by some scientific, social and culture recommendations, these recommendations could be applied in both Arab countries and African Countries with few modifications.
