Spherical Decompositions of Magnetic Fields and Magnetizations

Christian Gerhards

University of Vienna, Vienna, Austria (christian.gerhards@univie.ac.at)

Vectorial magnetic fields and corresponding vectorial magnetizations can be decomposed into poloidal and toroidal parts that allow an interpretation of the magnetic field in terms of internal and external contributions as well as a classification of the contributions of the magnetization that can be observed by satellite magnetic field measurements. Here, we present some considerations and examples on how localization constraints influence these properties.
