Homology Groups of High-Resolution Temporal Rainfall

Félix Fernández, Raciel Vásquez Aguilar, and Alin-Andrei Carsteanu School of Physics and Mathematics, National Polytechnic Institute (ESFM-Instituto Politécnico Nacional), Mexico City, Mexico (math.felix.fernandez@gmail.com)

This study applies topological data analysis, by generating homology groups to uncover patterns in the data of high-resolution temporal rainfall intensities from Iowa City (IIHR, U of Iowa). The state-space representation of the data is being investigated for an appropriate embedding dimension, in order to subsequently study topological properties of resulting manifold.
