

Plasma instabilities causing solar eruptions

Jörg Büchner

Max-Planck-Institut für Sonnensystemforschung, Göttingen, Germany (buechner@mps.mpg.de)

Twisted solar magnetic fluxes built free energy which is released in the course of solar flares and CME eruptions. The question, what triggers the eruptions, is still unsolved.

We report actual approaches to this problem by considering appropriate plasma instabilities which may occur while the solar magnetic fields in evolve in active regions of the Sun.
