## **Field trips - a teaching / learning strategy**

Nuno Ramos

Portugal (ramosnuno@live.com.pt)

At a time when the use of new technologies in the classroom and digital literacy is increasingly a reality that arises every day in our schools, it is intended to show learning strategies that do not take place inside the classroom and that allow students to build their knowledge in a more attractive and motivating way.

Nowadays, field trips are a learning experience rarely used by teachers. Since it is a teaching / learning strategy that arouses students' interest and leads them to active participation, this poster aims at showing the relevance that the accomplishment of this kind of activities can have in the learning level developed by the students, predominantly in the Geology area.

During the first term, the following contents were lectured: "Fossils and their importance for the reconstitution of Earth's history" and "Great stages in Earth's history". In order to show the relevance of this kind of activities, a field trip will be carried out to consolidate knowledge, mainly on these two topics.
