The ArcFlux project aims to determining the largest component to the Arctic Freshwater budget int the Arctic Ocean, namely the contribution from large rivers, glaciers as well as in-out flow of freshwater through the ocean pathways.

The main objectives of the project is to: Identify the major challenges associated with estimation of the Arctic Freshwater budget and Explore, develop and validate different approaches to address the identified challenges and enhance current approaches to compute the freshwater budget in the Arctic and compute a multi-year assessment of the Arctic freshwater budget based on the developed methodology. Finally the obtained results will be evaluated and the project will develop a scientific roadmap for future research activities in this domain of estimating the FWB of the Arctic Ocean.

Arcflux is supported in 2017 and 2018 within the ESA CLIC initiative which Is a part of the support to Science Elements framework
