The AEROCLO-sA project (Aerosol, Radiation and CLOUDs in southern Africa) investigates the role of aerosols on the regional climate of southern Africa. The region is characterized by high atmospheric aerosol loadings originated from biomass burning, mineral dust and marine sea salt. In addition it is influenced by strong marine biological emissions by the Benguela upwelling and a semi-permanent and extended stratocumulus cloud deck. This area therefore provides an exceptional natural laboratory for studying the full range of aerosol physico-chemical properties, aerosol-radiation and aerosol-cloud interactions and their perturbations of the Earth's radiation budget.

AEROCLO-sA is based on a field campaign conducted for a month in August-September 2017 over Namibia. An instrumented mobile station was implemented at ground over coastal Namibia in order to document fog, clouds, aerosols, volatile organic compounds and other traces gases at the ocean-atmosphere interface. State of the state-of-the-art instrumentation for the retrieval of chemical and physical properties of aerosol as time of flight aerosol mass spectrometer, scanning mobility particle sizer, particle counters, cloud condensation nuclei counter were deployed.

Preliminary results from on-line data analysis indicate that the sub-micrometer aerosol is dominated by sulphate and sea salt followed by organic compounds. A diurnal cycle of iodide species was observed in accumulation mode particles. New particle formation events were often observed. Additional information from on-line analysis on water-soluble fraction on TSP (PILS-IC) and off-line analysis (filters and TEM grids) will complete our view of the aerosol chemical composition in this region. Furthermore particle phase composition will be compared with ground-based gas phase composition, CCN measurements, fog chemical composition and combined with information from the back-trajectories of air masses. The full set of data will improve our understating of emissions and mechanisms occurring at the ocean-atmosphere interface in this region.
