The International GNSS Service (IGS) enables high-accuracy usability of Global Navigation Satellite System technologies by producing high-quality openly and readily available GNSS data and products. This poster will present an update on current IGS products and operations, and inform session participants and visitors about the Service and its social benefits. Information about the IGS stations and network, contributions to the International Terrestrial Reference Frame solutions, and product applications will be presented. A summary of IGS products, in particular how they are made, and their availability will be provided. Key points from the most recent IGS Strategic Plan will also be highlighted.
