Ensuring Science in Tomorrow's Classroom is engaging and interactive: Geology Through Chocolate

Kate Stockings

Loughton, United Kingdom (kstockings@rodingvalley.net)

The teaching content crossovers between the sciences and geography are multiple and thus, in my role as Head of Geography, I am frequently presented with the challenge of making the scientific study of physical geography engaging and memorable for students. One of the most successful ways through which this has been achieved is through using chocolate to study geology.

Through explaining this idea and the resources used to enable students to be independent in their initial learning of geology, I will seek to share an activity suitable for all ages and multiple subjects.

The poster will provide photographs, instructions and guidance for running this activity to ensure that all attendees leave able to facilitate this lesson.
