Looking for Snow Man on Star Mountain

How can we see global warming by observing the nature that surrounds us?

In fact, do climate change really exist?

Can we observe them?

From 30 thousand years ago until 10,000 years ago, the planet was covered with ice and snow, with very low temperatures. It was the last Glaciation.

The average level of water in the oceans has dropped.

The continental area exposed to the surface has increased.

The Afonso de Albuquerque School is in the area of aspiring Geopark Star, which is an excellent laboratory for understanding these phenomena of climate change.

Wrum's last glaciation is well marked on the rocks of the Star Geopark and on ecosystems.

Elementary and secondary school students show us these discoveries through very interesting schemes, photographs and models, which will be presented at the next GIFT EGU in April 2018 in Vienna, Austria.
