

StraboSpot Data System – An Update

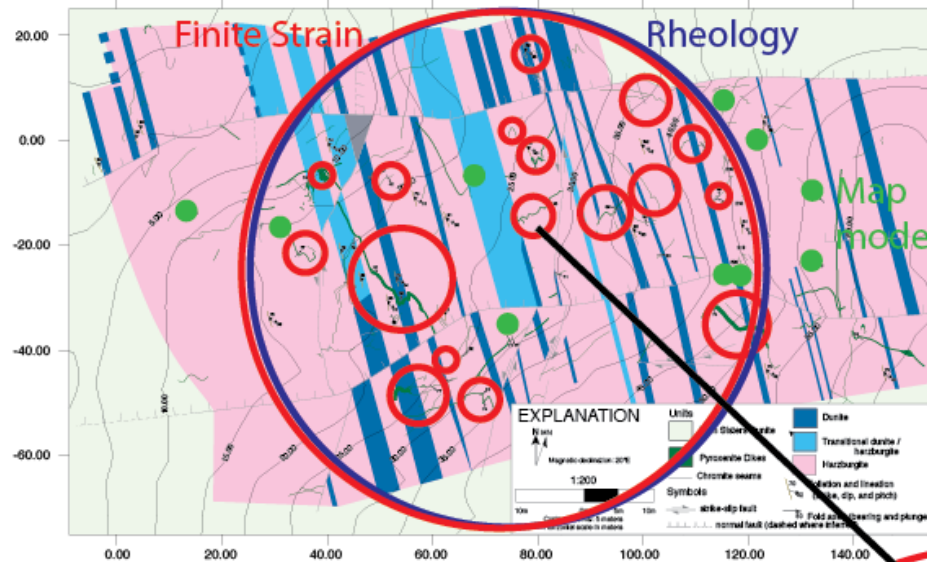

- Little bit of review
- Keeping track of Spots: Nests (Spatial) and Tags (Conceptual)
- Capabilities – Disciplines engaged in StraboSpot
 - Quick updates on petrology, sedimentology, experimental rock mechanics, microstructures/thin section
- Moving on to StraboSpot 2.0

StraboSpot Uses Spots

A Spot can contain a single measurement or an aggregation of individual measurements to characterize a geologic feature or interpret a geologic concept

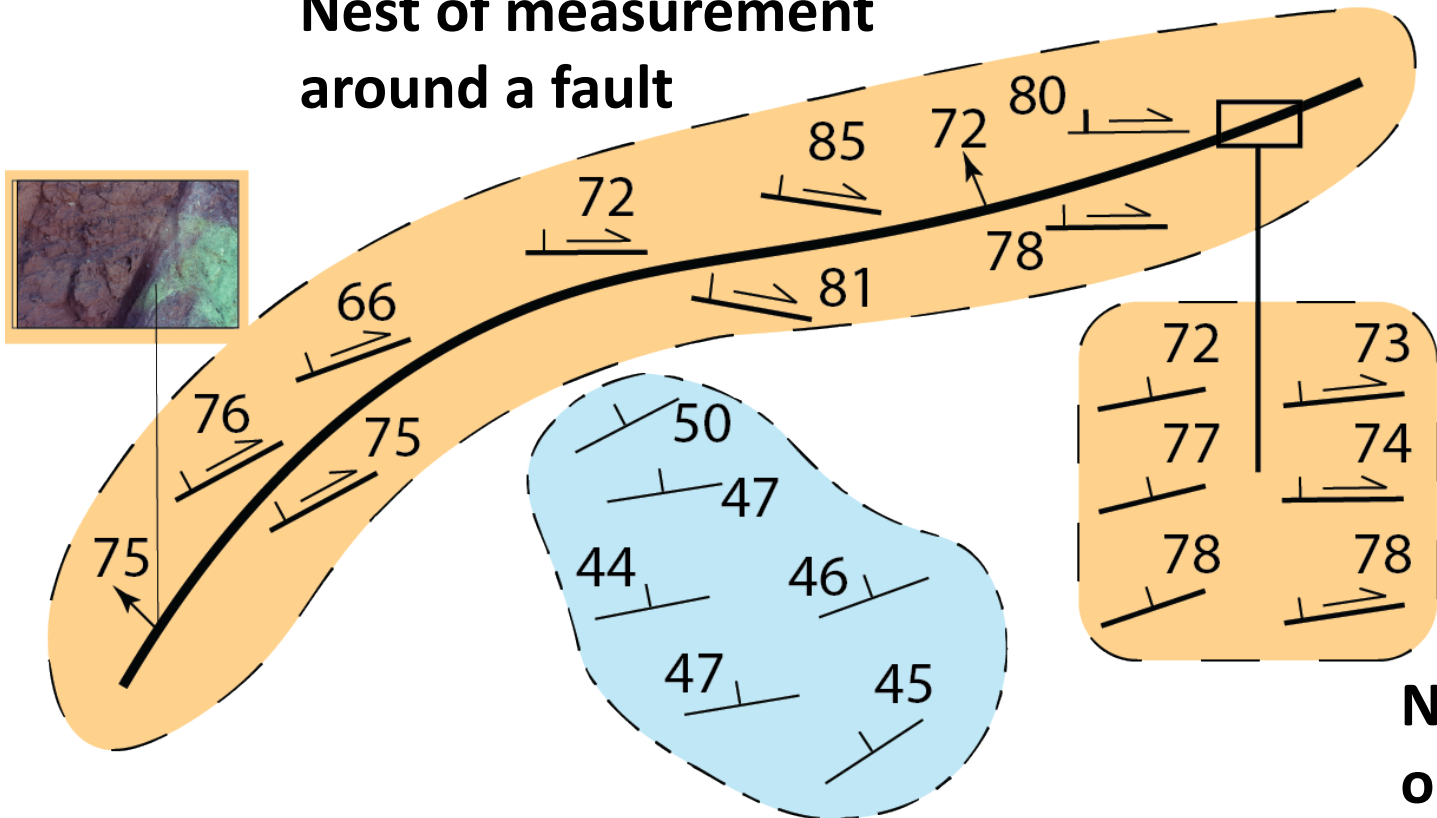

Spots are spatially hierarchical

Spots can be Nested

A Nest is a spatial grouping of spots

**Nest of measurement
around a fault**

**Nest at a point
on a fault**

Spots can be grouped logically:

Tags act like sticky notes on Spots or Multiple Spots

Graph approach of StraboSpot

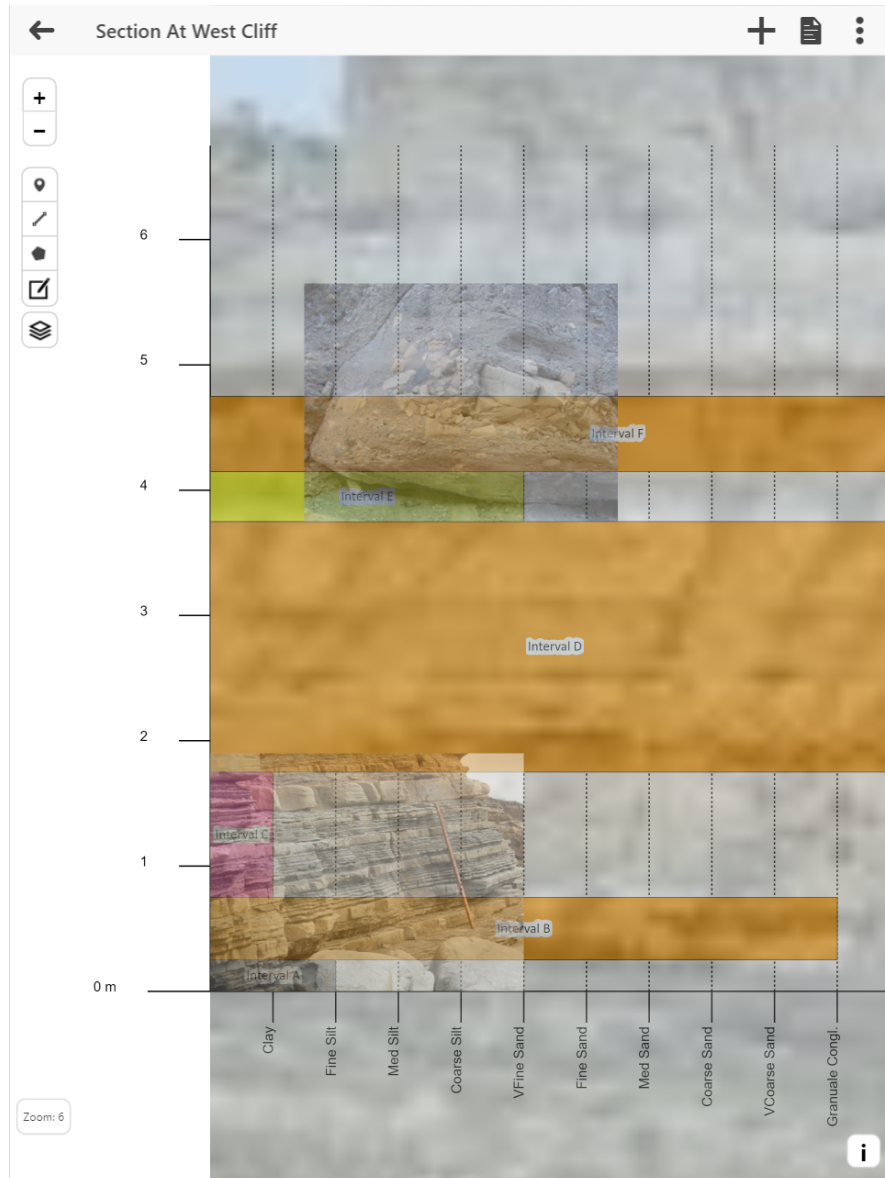

Capabilities

- Geological field mapping
- Structural geology
- Petrology
- Sedimentology
- Experimental rock mechanics
- Thin section (micrograph)
 - Utilized by most geological disciplines

Strat Mode

Integrate measurements of stratigraphic sections with all forms of documentation and images. Produce schematic sections recognizable by practitioners.

StraboSpot expands to Laboratory Data

microstructural data

experimental data

Natural samples are linked to their geologic context (deformed under natural conditions of $P, T, \sigma, \epsilon, \dot{\epsilon}$...)

StraboSpot Mobile application

Known orientation with respect to field location

Field context

Experimental context

Sample

Known orientation with respect to experimental setup

Known orientation and scale

Thin section, Billet, or Core

StraboSpot Desktop app for rock deformation experiments (in development)

Experiments are linked to their mechanical data and experimental metadata

EPOS (European Plate Observing System)

The EPOS initiative will require all European labs to use an EPOS approved header on their data files.

1. EPOS includes an initiative for experimental rock deformation (but not microstructures).
2. Researchers provide to EPOS key terms that can be used to find their data. But, EPOS does not store the values of that data. Therefore, EPOS will not be searchable for results or experimental conditions.
3. EPOS (led by Dr. Audrey Ougier-Simonin) – aided by the StraboSpot team - have developed a vocabulary used for experimental rock deformation.

The StraboSpot My Maps interface allows you to upload your own custom GeoTIFF map files for inclusion in the StraboSpot mobile and desktop apps. Files are accepted in .tif rectified GeoTIFF format up to 500MB in size. The preferred coordinate system for uploaded files is WGS 84. If another coordinate system is provided, the file will be automatically converted which may result in undesirable map appearance.
