Overview

GR is a family of **lumped hydrological models** designed for streamflow simulation at various time steps

The models are freely available in an **R-package** called **airGR** (Coron et al., 2017, 2020)

The models can easily be implemented on a set of catchments with limited data requirements

GR4J model diagram

Overview

The airGR package

- Package for the  language
- Freely available on the Comprehensive  Archive Network
<https://CRAN.R-project.org/package=airGR>

The GR hydrological models

- Designed with the objective to be as efficient as possible for streamflow simulation at various time steps (from hourly to interannual)
- Warranted complexity structures and limited data requirements
- Can be applied on a wide range of conditions, including snowy catchments (CemaNeige snow routine included)

New features

New features since EGU-2019

- New **GR5H** model (cf. Ficchi *et al.*, 2019):
 - ▶ new model structure with interception store for improved consistency and performance
 - ▶ can be coupled with the **CemaNeige** snow module
 - ▶ new `Imax()` function allowing to estimate the maximum capacity of the interception store
- The **GR4H** model can be coupled with **CemaNeige**
- The `plot()` function now allows to display new time series:
 - ▶ actual evapotranspiration
 - ▶ streamflow error
- The `CreateInputsCrit()` function allows new streamflow transformations:
 - ▶ power (negative or positive)
 - ▶ Box-Cox
- A DOI allows to identify the package manual (in addition of the scientific article)

GR5H: hourly model with a new interception store

Aims

- Better representation of the impact of vegetation on evaporation fluxes
- Improved model showed a better consistency of model fluxes over time (stable water fluxes across time steps respecting mass conservation)
- Finer representation of the interception processes at the hourly time step
- Higher model performance proved over a wide range of catchments with particularly improved bias, especially over high flows
- Model parameters become more robust and stable (across time steps) as the flux-matching condition is satisfied

Hands-on in : inputs preparation

```
## package loading
library(airGR)

## load of catchment data
data(L0123003)

## preparation of the InputsModel object
InputsModel <- CreateInputsModel(FUN_MOD = RunModel_GR5H,
                                  DatesR   = BasinObs$DatesR,
                                  Precip    = BasinObs$P,
                                  PotEvap   = BasinObs$E)

## run period selection
Ind_Run <- seq(which(format(BasinObs$DatesR, format = "%Y-%m-%d %H")=="2006-01-01 00"),
               which(format(BasinObs$DatesR, format = "%Y-%m-%d %H")=="2007-12-31 23"))
```

Hands-on in : run options

Imax

- It represents the maximum capacity of the interception store
- Its value is adjusted to match the fluxes simulated by the GR4J daily model (neutralisation of precipitation and potential evapotranspiration)

```
## Imax computation
```

```
Imax <- Imax(InputsModel = InputsModel,
             IndPeriod_Run = Ind_Run,
             TestedValues = seq(from = 0, to = 3, by = 0.2))
```

```
## preparation of the RunOptions object
```

```
RunOptions <- CreateRunOptions(FUN_MOD = RunModel_GR5H,
                               InputsModel = InputsModel,
                               IndPeriod_Run = Ind_Run,
                               Imax = Imax)
```

Hands-on in : simulation

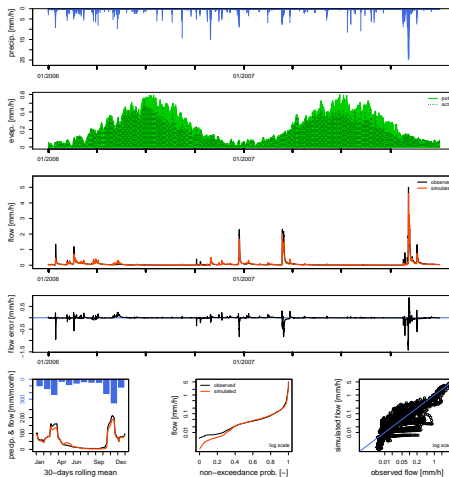

```
## parameter set (can come from an automatic calibration)
Param <- c(X1 = 706.912, X2 = -0.163, X3 = 188.880, X4 = 2.575, X5 = 0.104)

## simulation
OutputsModel <- RunModel_GR5H(InputsModel = InputsModel,
                               RunOptions = RunOptions,
                               Param = Param)
```

Hands-on in : graphical assessment of the results

```
## results preview
```

```
plot(OutputsModel, Qobs = BasinObs$Qmm[Ind_Run], which = "all")
```

Hands-on in : numerical assessment of the results

```
## efficiency criterion preparation
InputsCrit <- CreateInputsCrit(FUN_CRIT = ErrorCrit_NSE,
                               InputsModel = InputsModel,
                               RunOptions = RunOptions,
                               Obs = BasinObs$Qmm[Ind_Run])

## efficiency criterion computation
OutputsCrit <- ErrorCrit_KGE(InputsCrit = InputsCrit,
                              OutputsModel = OutputsModel)

## Crit. KGE[Q] = 0.8386
## SubCrit. KGE[Q] cor(sim, obs, "pearson") = 0.9505
## SubCrit. KGE[Q] sd(sim)/sd(obs) = 0.8748
## SubCrit. KGE[Q] mean(sim)/mean(obs) = 0.9110
```

airGR: the INRAE GR Hydrological Models in a R Package

Update: 2020-03-12

1 What is the airGR package?

1.1 Presentation

airGR is a package which brings into the R software the hydrological modelling tools used and developed at the Catchment Hydrology Research Group of INRAE (France), including the GR rainfall-runoff models and a snowmelt and accumulation model, CemaNeige. Each model core is coded in Fortran to ensure low computational time. The other package functions (i.e. mainly the calibration algorithm and the efficiency criteria calculation) are coded in R.

The airGR package has been designed to fulfill two major requirements: to facilitate the use by non-expert users and to allow flexibility regarding the addition of external criteria, models or calibration algorithms. The names of the functions and their arguments were chosen to this end. airGR also contains basics plotting facilities.

1.2 The airGR hydrological models

Six hydrological models and one snowmelt and accumulation model are implemented in airGR. The snow model can be used alone or together with the daily hydrological models.

The models can be called within airGR using the following functions:

- `RunModel_GR4H()`: four-parameter hourly lumped hydrological model (Mathevet 2005)
- `RunModel_GR4J()`: five-parameter hourly lumped hydrological model (Pischi 2017; Pich, Perrin, and Andréassian 2019)
- `RunModel_GR4J2()`: four-parameter daily lumped hydrological model (Perrin, Michel, and Andréassian 2009)
- `RunModel_GR5J()`: five-parameter daily lumped hydrological model (Le Moine 2008)
- `RunModel_GR6J()`: six-parameter daily lumped hydrological model (Pushpalatha et al. 2011)
- `RunModel_GR2M()`: two-parameter monthly lumped hydrological model (Mouelhi 2003; Mouelhi et al. 2006a)
- `RunModel_GR1A()`: one-parameter yearly lumped hydrological model (Mouelhi 2003; Mouelhi et al. 2006a)
- `RunModel_CemaNeige()`: two-parameter degree-day snowmelt and accumulation model (Valéry, Andréassian, and Perrin 2014)
- `RunModel_CemaNeigeGR4H()`: combined use of GR4H and CemaNeige
- `RunModel_CemaNeigeGR4J()`: combined use of GR4J and CemaNeige
- `RunModel_CemaNeigeGR4J2()`: combined use of GR4J2 and CemaNeige
- `RunModel_CemaNeigeGR5J()`: combined use of GR5J and CemaNeige
- `RunModel_CemaNeigeGR6J()`: combined use of GR6J and CemaNeige
