This contribution has two aims:

1. To present a new tool written in C++ and based on Root Bundle Model with Weibull survival function (RBMw, Schwarz et al 2013), called **RBM++**, easy to use that enables anyone to quantify the effect of roots on slope stability.
2. To show new parameters of root reinforcement effects of *Robinia pseudoacacia* (L.), species commonly used for the mitigation of rainfall-induced landslides at small scale.

By using the Root Bundle Model with Weibull survival function (Schwarz et al, 2013). Recent studies have shown how the RBMw is a very efficient model by considering the heterogeneity of both root mechanical characteristics and their distribution in the soil.

A new tool to accurately calculate root reinforcement: the Root Bundle Model software RBM++

**1. Insert the two input files  
and choose the folder in  
which to insert the  
output files.**

2. Choose the calculation mode you prefer:
- User Define if you have the mechanical parameters of the roots;
  - or choose the species from the list.

**3.A Species Choice:**  
**Data analysis choosing**  
**Black Locust species.**  
**This tool will also contain**  
**values on the mechanical**  
**properties of the roots of**  
**this species, obtained from**  
**recent studies.**

#### 4.A Map root reinforcement space distribution:

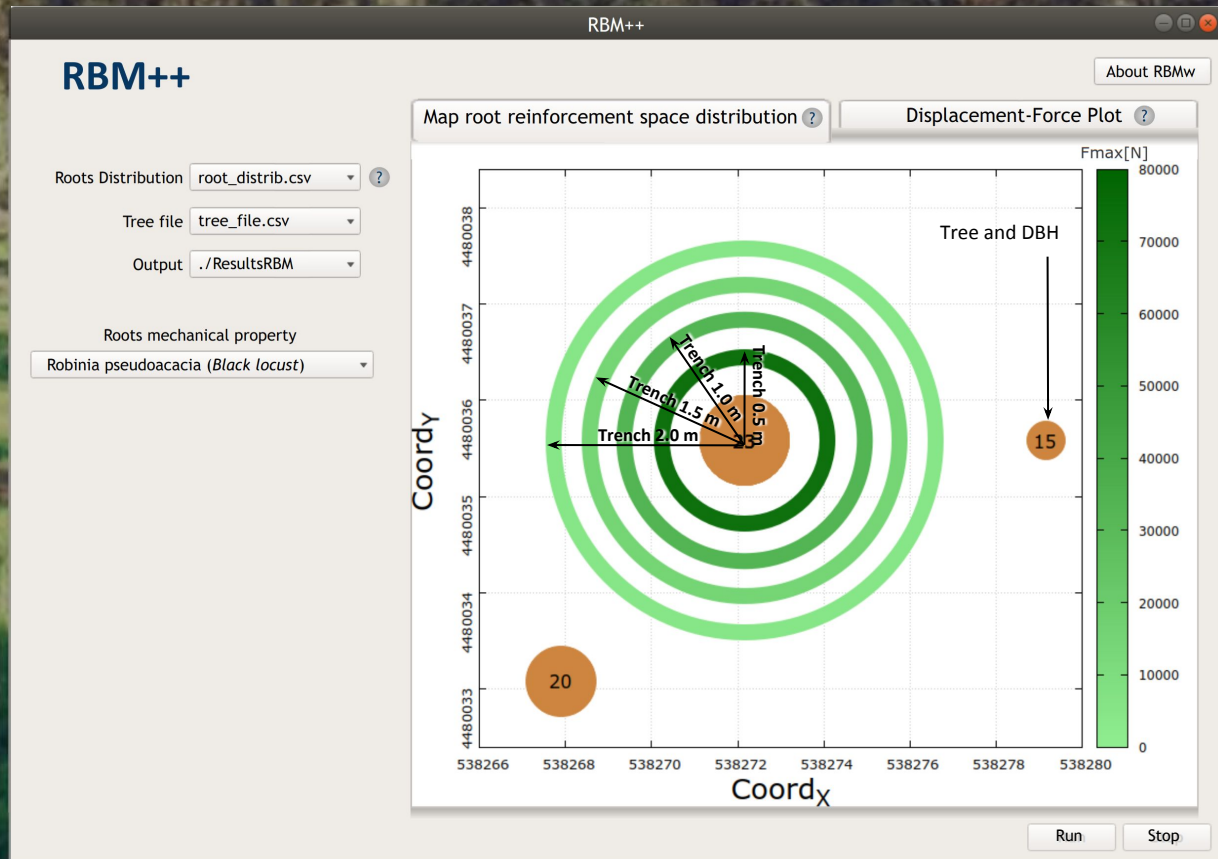

The spatial distribution of the trees and their diameters at 1.3 m (DBH) can be displayed.

For trees where the root distribution has been analyzed, it is possible to visualize the trenches and display the maximum estimated force based on the intensity of the color.

A new tool to accurately calculate root reinforcement: the Root Bundle Model software RBM++

In this example the density of the root diameter classes was analyzed on 4 trenches 0.5m apart.

## 4.B Displacement-Force

### Plot:

you can view the change in force as a function of the displacement in detail for each trench.

**3.B User Define:**  
Using the RBMw equations  
in the literature (*Schwarz  
2013, Dazio 2018*), estimate  
the required parameters  
from the data collected in  
the field and enter them in  
the appropriate box.

**RBM++ makes it easier** to share and exchange knowledge related to **root reinforcement**. Therefore, it will allow the realization of a database containing standard data on root mechanical behavior of tree species commonly used for **shallow landslide mitigation**.
