

CMEMS Primary production from satellite remote sensing: spatial and temporal evolution and comparison with other products

Marine Bretagnon, Philippe Garnesson, Antoine Mangin

Primary production:

- Taken up about 50% of anthropogenic CO₂ emission
 - Constitute the basis of marine food web

Light and Dark Bottle Method;
Measure dissolved oxygen in the
Bottles (before and after “incubation”)

In situ measurements

Different protocols used (^{14}C incubation, oxygen incubation, etc...)
Costing and scattered measurement

Light and Dark Bottle Method;
Measure dissolved oxygen in the
Bottles (before and after “incubation”)

$$P(z, t, \lambda) = 12 * chl(z, t) * a^*(z, t, \lambda) * PAR(z, t, \lambda) * \phi(z, t, \lambda)$$

Energy absorbed by algae

Transformation efficiency
of energy into carbon

Satellite observations:

- Palliate the scarcity of in situ measurements
- Offer 21 years of archive
- Antoine and Morel 1996 algorithm used

Implemented by [Mercator Ocean International](#) as part of the [Copernicus Programme](#)

WMS

Sub-setting

- Most of the discrepancies occurred in oligotrophic waters
- Seasonal cycle roughly equivalent for both estimates

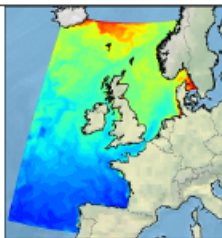

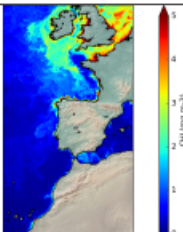

- The west-to-east decreasing gradient partly explained by nutricline position relatively to the euphotic depth
- Modulation of primary production follows the nutricline vertical displacement

Model

PISCES + IBI

PISCES + ERSEM

Bay of Biscay

North West Shelf

Seasonal cycle in phase but discrepancy of intensity for both model

Bay of Biscay

North West Shelf

Satellite

Model

Bay of Biscay

PP decrease comprise between 20.4 and 24.6 mgC.m^{-2} over the archive

Reverse trend over the archive for satellite and model.

North West Shelf

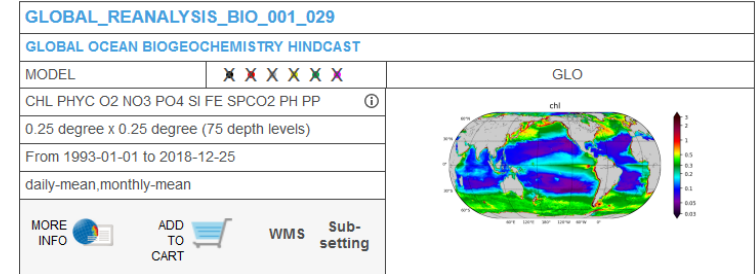

Over the 20 years archive:

- Biomass ↓
- Temperature ↑
- Light ↓
- Mixed layer depth ↓

NEMO-PISCES model

Model: difficulty to get the inter-annual variability ?

Satellite: underestimation of the signal due to monthly smoothing ?

Smooth seasonal cycle due to average over North and South Hemisphere

Satellite estimate: decrease of 41 mgC.m⁻² over the archive

Very low variation of parameters affecting PP
Potential decrease of PP due to decreasing light

- Complementarity of satellite observations and modelling outputs
- Allow to investigate of biogeochemical and physical processes
- Under estimation of modelling outputs for the Atlantic
- Estimate the impact of data assimilation
- Potential decrease of primary production at global scale and for the Northern Atlantic
