Deglacial ^{14}C reservoir ages of surface waters at the northern boundary of Peruvian coastal upwelling

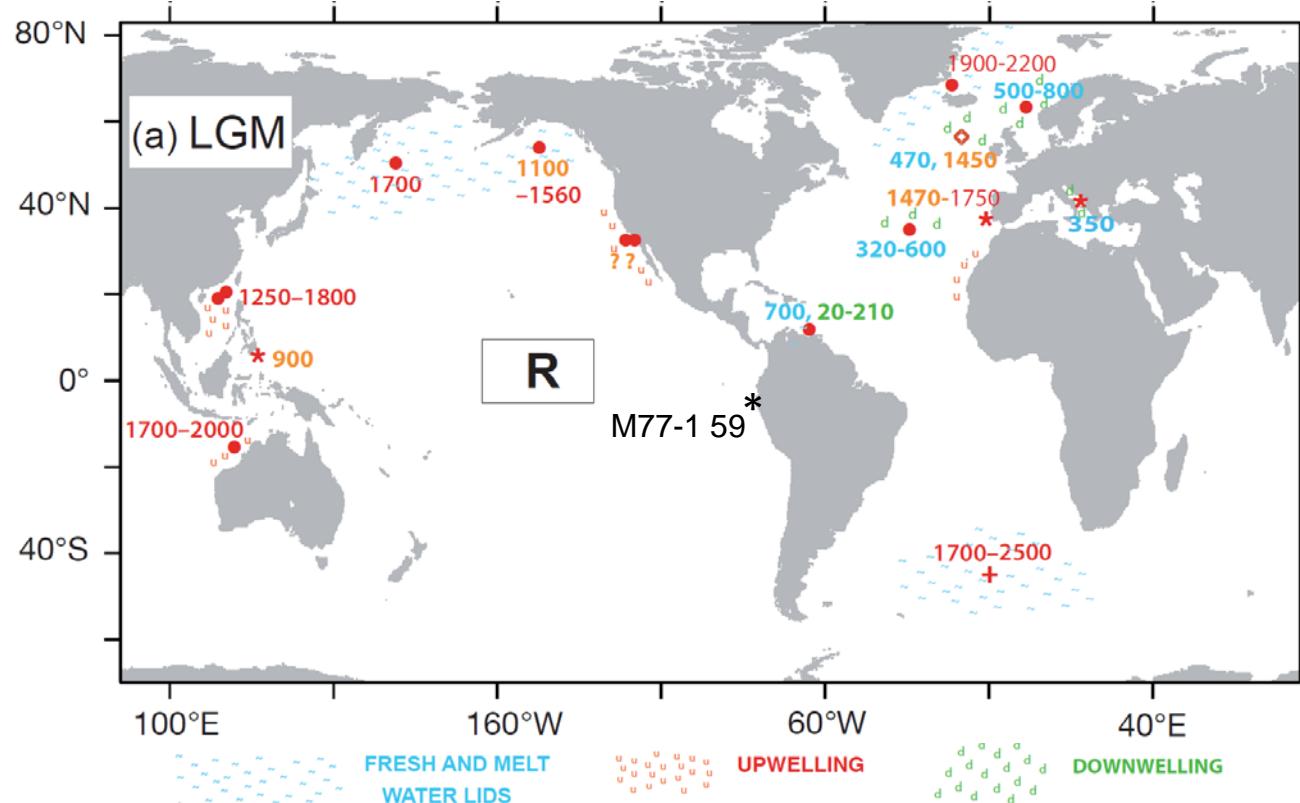

N. Glock, M. Sarnthein, K. Doering, G. Mollenhauer & R. Salvatteci

Presentation in EGU2020 session CL5.3

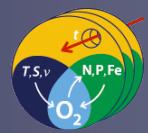

(Friday 08 May 2020; 16:45-18:00)

Introduction

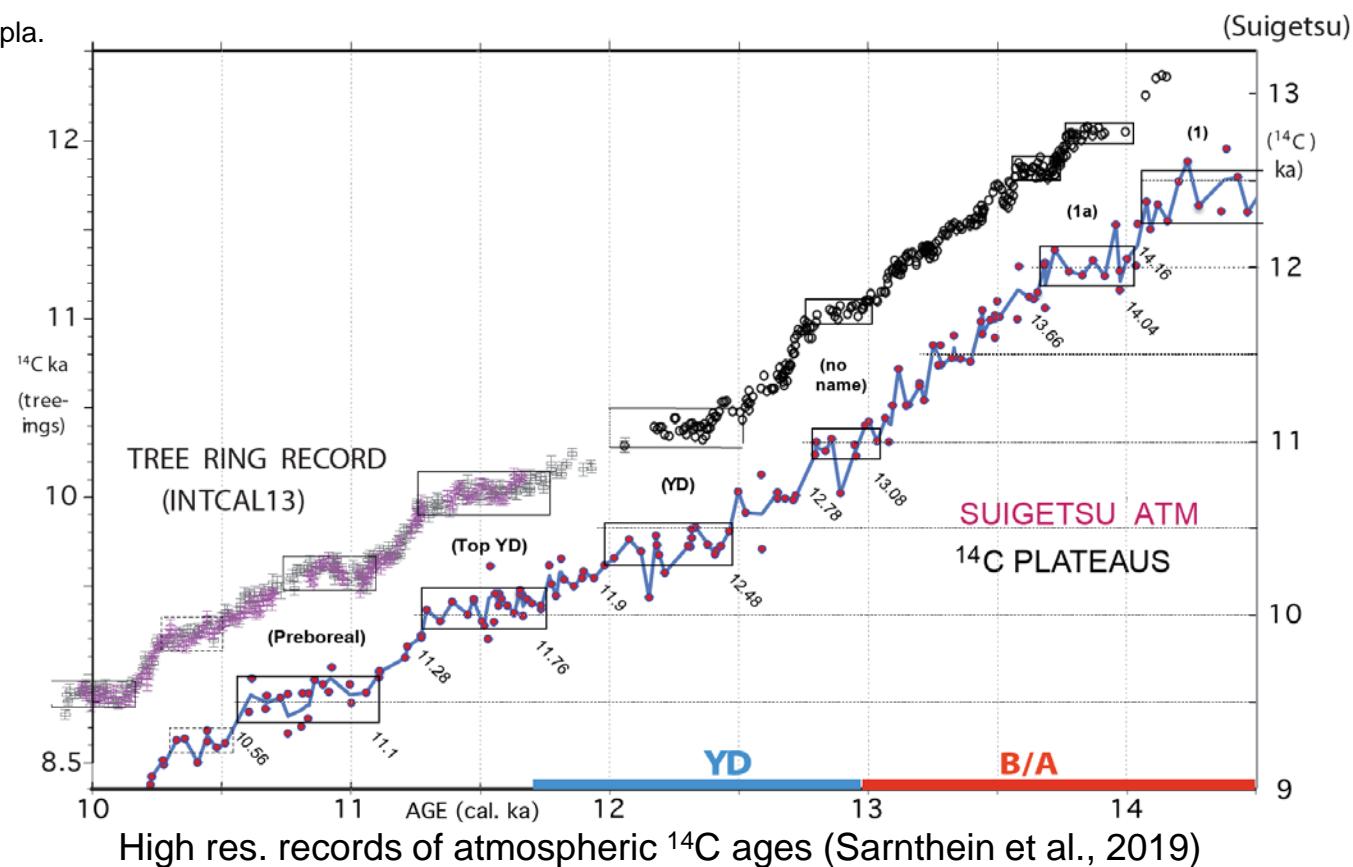

- Surface water ^{14}C ages are not in equilibrium with atmospheric ^{14}C .
- For accurate dating, planktonic ^{14}C ages need to be corrected for changes in the reservoir age (R_{pla}) of surface waters

Distribution of R_{pla} during the Last Glacial Maximum (Sarnthein et al., 2015)

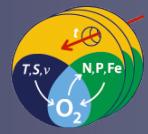

Introduction

- The U/Th age-calibrated suite of atm. ^{14}C plateau boundaries serve as stratigraphic tie points for absolute age control.
- The difference between atm. and pla. ^{14}C ages of each individual plateau provides an estimate of local R_{pla} .

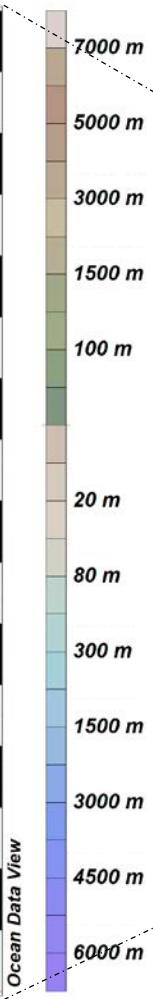

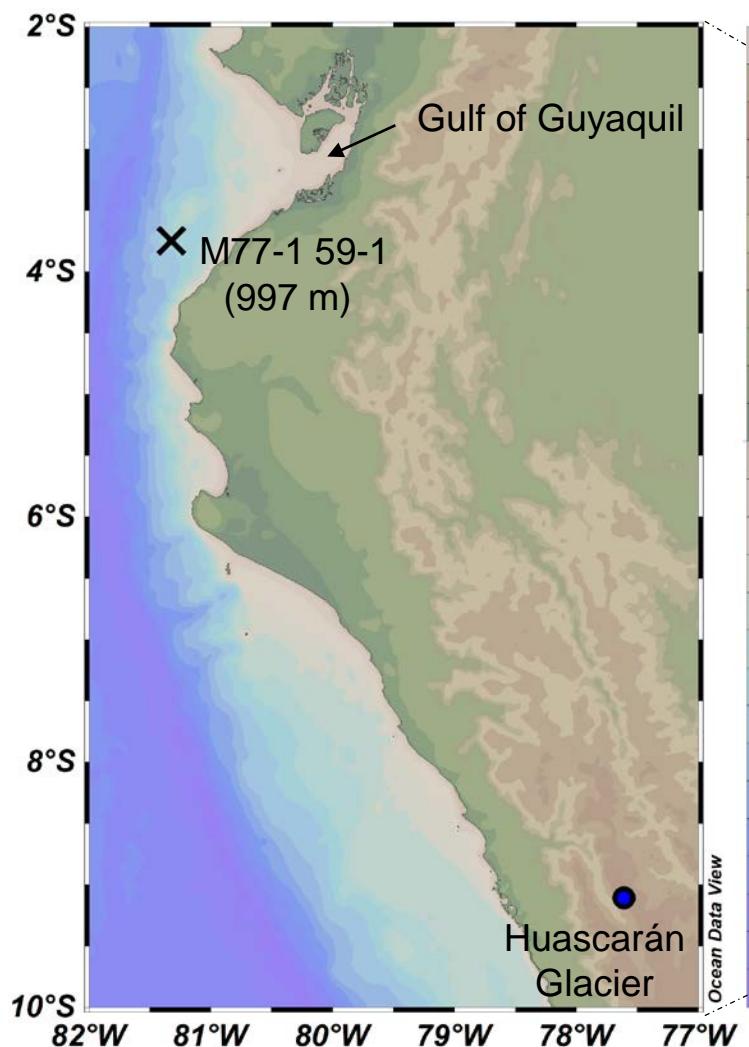

Deglacial ^{14}C reservoir ages of surface waters off Peru

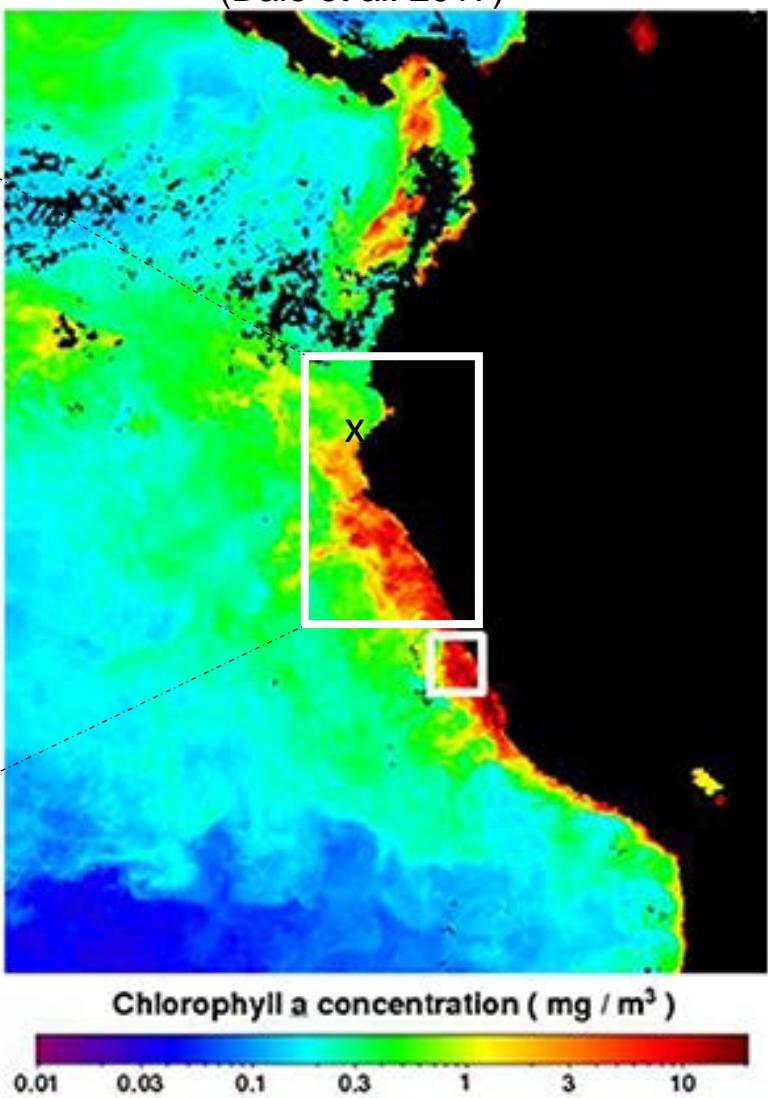

Core location: M77-1 59-1

Deglacial ^{14}C reservoir ages of surface waters off Peru

Results: Comparison of sedimentation with terrestrial records

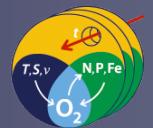

SFB 754

CONCLUSIONS

- ^{14}C plateau tuning established accurate centennial-scale age control
- Deglacial reservoir ages (R_{pla}) off North-Peru are high (800-1250 ^{14}C yr) due to nearby coastal upwelling
- Enhanced upwelling and cold SST match high $R_{\text{pla}} = \text{La Niña}$ regime
Weak upwelling and warm SST match reduced $R_{\text{pla}} = \text{El Niño}$ regime
- Changes in sedimentation rates are governed by deglacial meltwater input (via the Gulf of Guayaquil)
