# Laboratory lysimeters and proximal sensing data for optimizing irrigation water needs

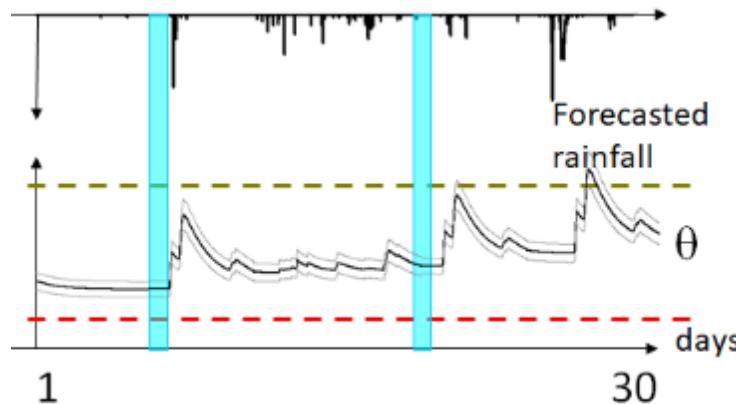

Nicola Paciolla, Imen Ben Charfi, Chiara Corbari, and Marco Mancini

[chiara.corbari@polimi.it](mailto:chiara.corbari@polimi.it), [nicola.paciolla@polimi.it](mailto:nicola.paciolla@polimi.it)

## Objectives

Laboratory experiments with a lysimeter which is fully equipped to measure all the processes of the hydrological cycle

1. Monitoring of soil moisture profiles and the different hydrological processes in the laboratory lysimeter
2. Definition of the irrigation water requirements for different crops

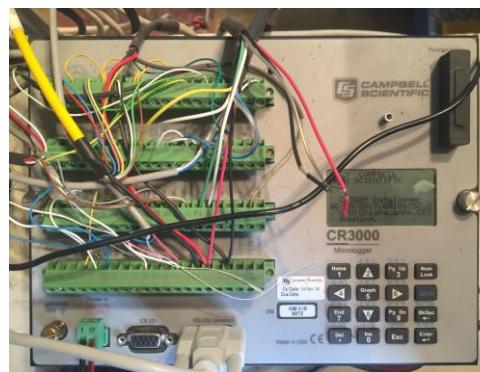

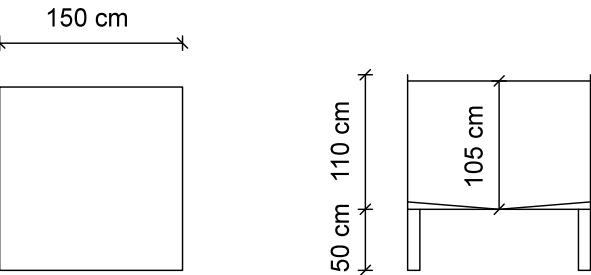

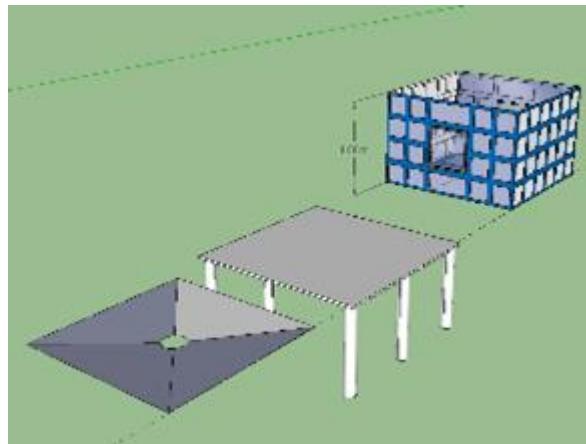

A weighing lysimeter is simply a large “flower pot”

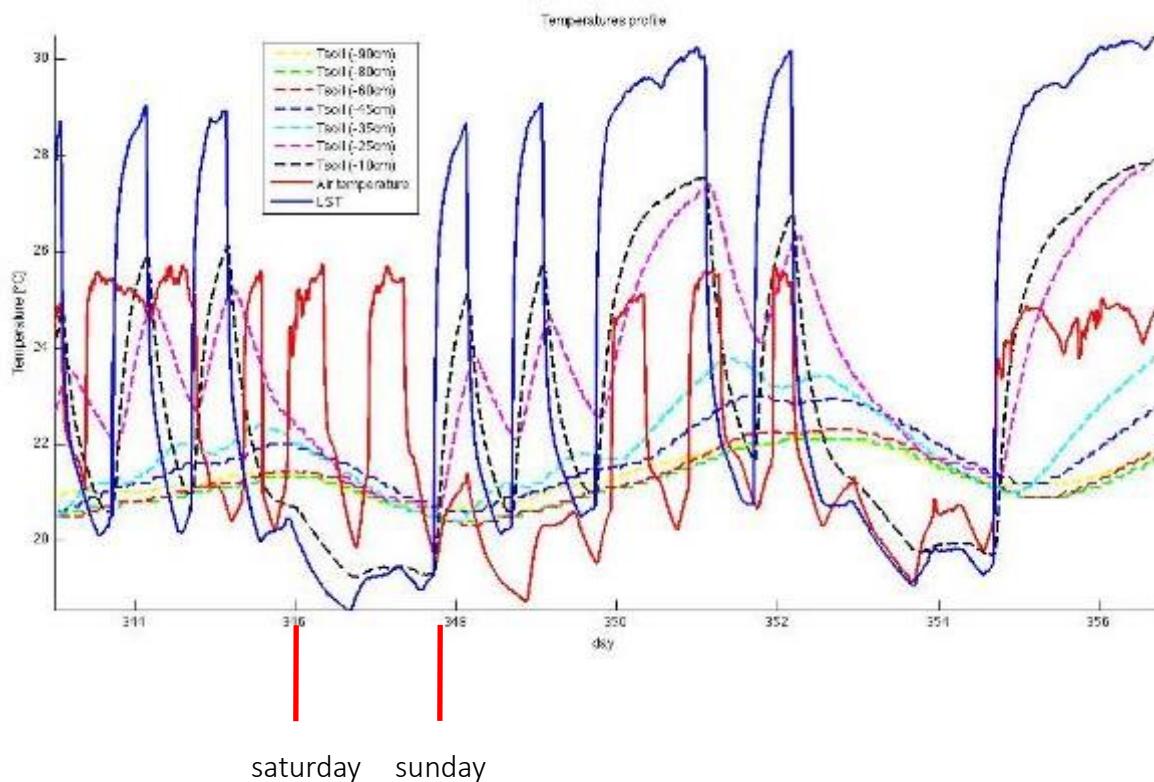

## The lysimeter: project and instruments

Structure weight = 956kg  
 Soil volume = 2.25m<sup>3</sup>

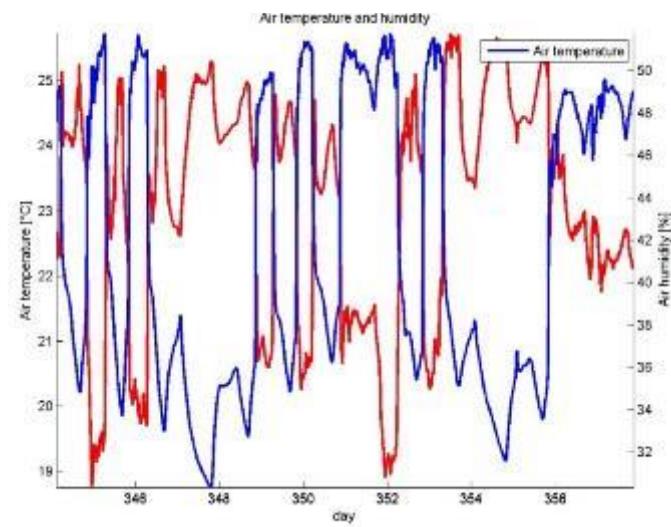

# Meteorological conditions of the lab and temperature profiles

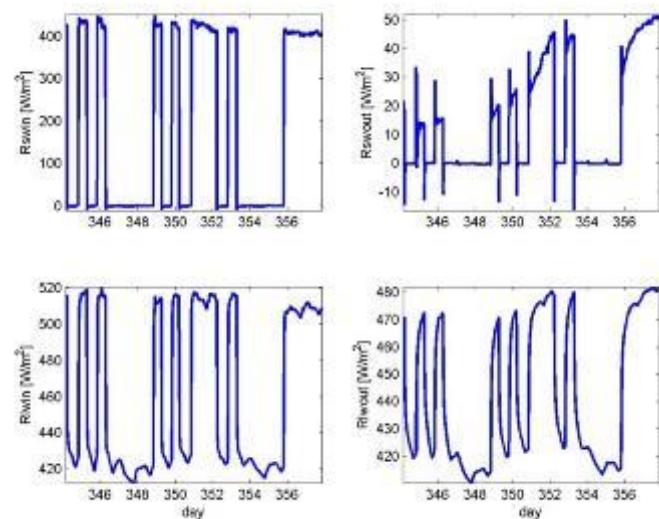

- Daily cycle for air temperature, LST and soil superficial Temperature
- Weekly cycle for the soil deeper probes

Air temperature and humidity

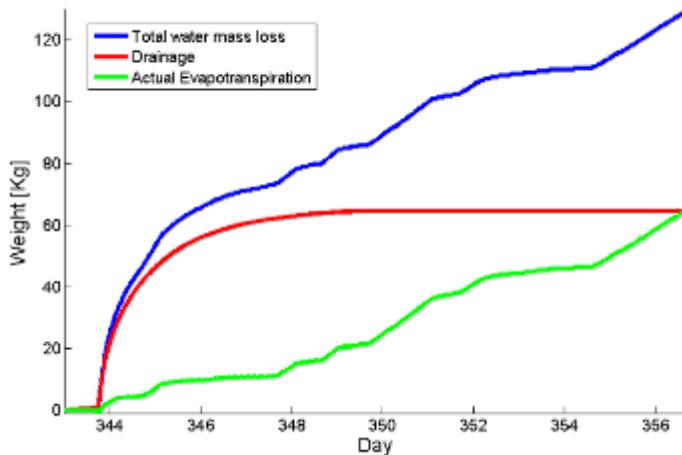

Net radiation

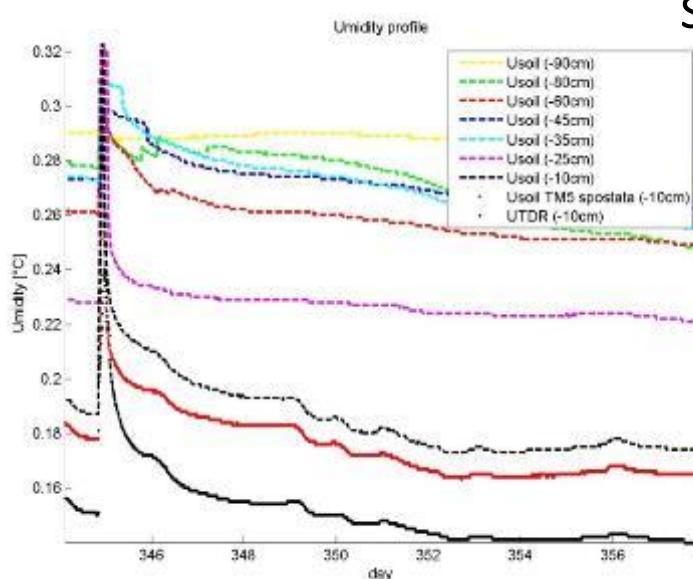

# Evapotranspiration estimates and soil moisture profiles

Evapotranspiration estimated from the difference between the scale weight change and the drainage flux

$$ET_{eff} = DP - Q_{perc} = 68.38 \text{ kg}$$

$DP$  → weight change (133kg)  
 $Q_{perc}$  → drainage from rain gauges (64.62kg)

## Soil moisture profiles

Saturation soil moisture value reached by the superficial probes (10 cm, 25 cm)

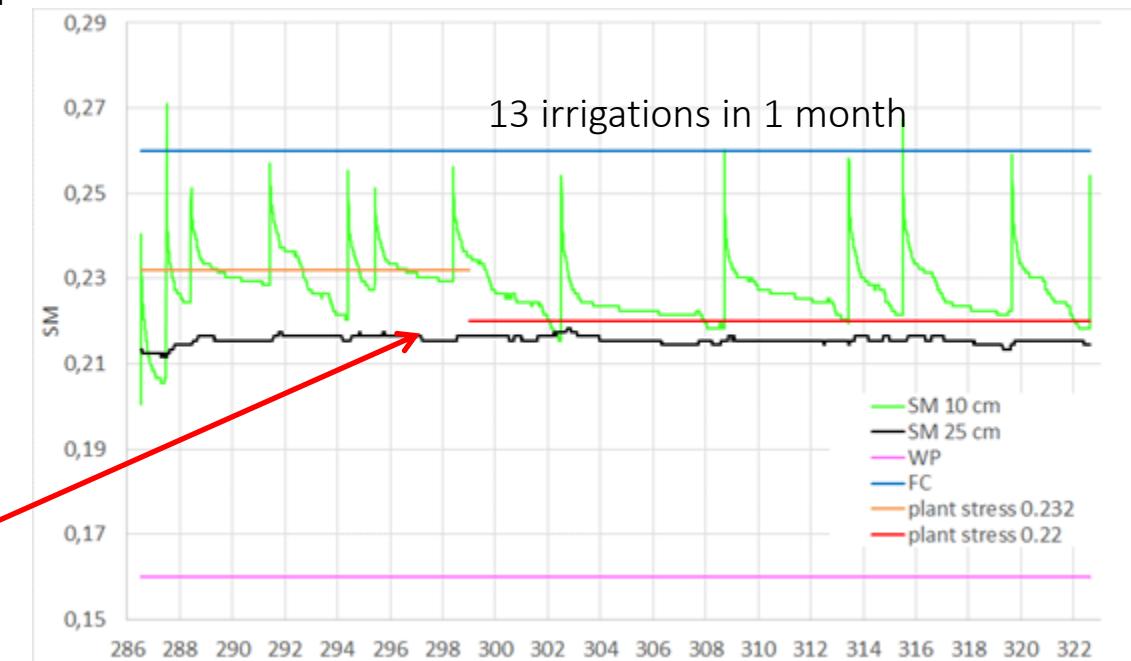

18 hours before irrigation  
 Just after irrigation  
 2 h after irrigation  
 27 h after irrigation  
 13 days after irrigation

# What happens with vegetation? When to irrigate?

Triggering irrigation according to measured (or forecasted) **soil moisture** value and plant stress threshold

After 14 days the plant threshold (from FAO) is lowered

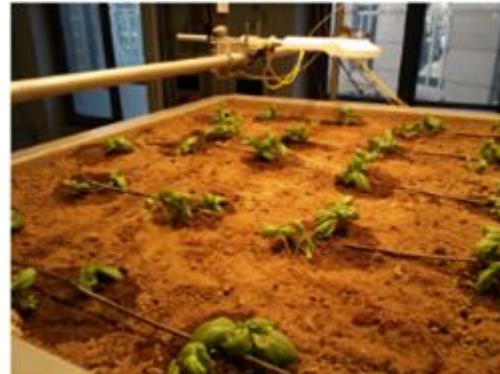

Basil planted on 12 october (day 286)

17 november (day322)

Stress threshold is a function of:

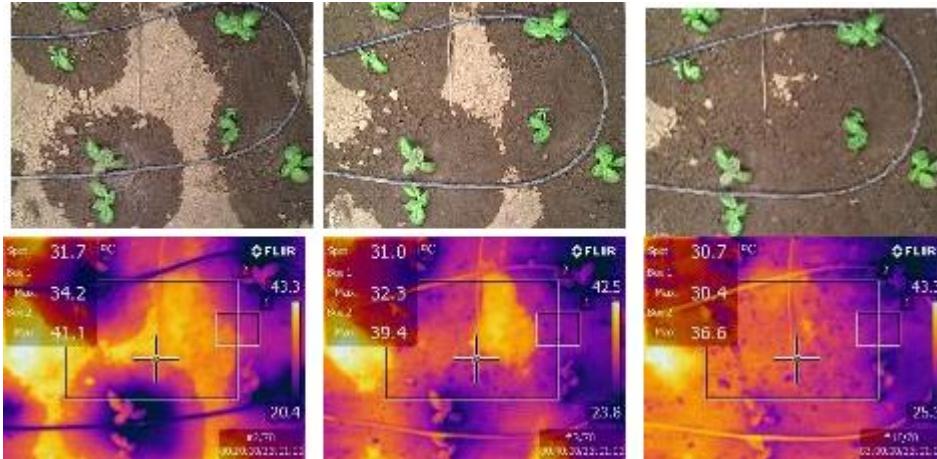

- soil type
- vegetation type
- vegetation growth stage
- climatology

(<http://www.fao.org/>)

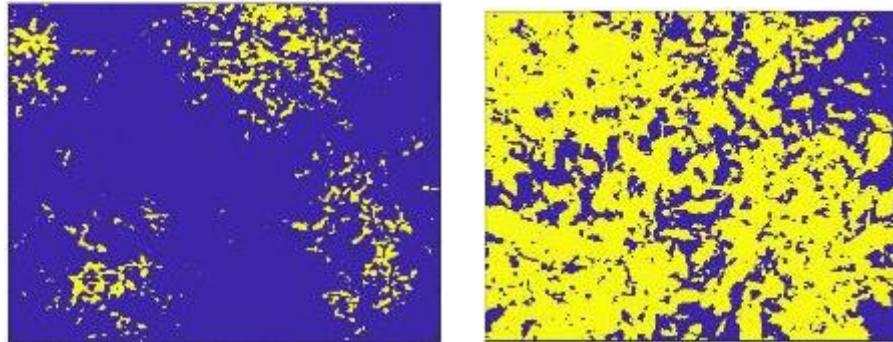

# LST changes and Leaf area index estimation

13 october during irrigation

03/11

18/12

Vegetation fraction

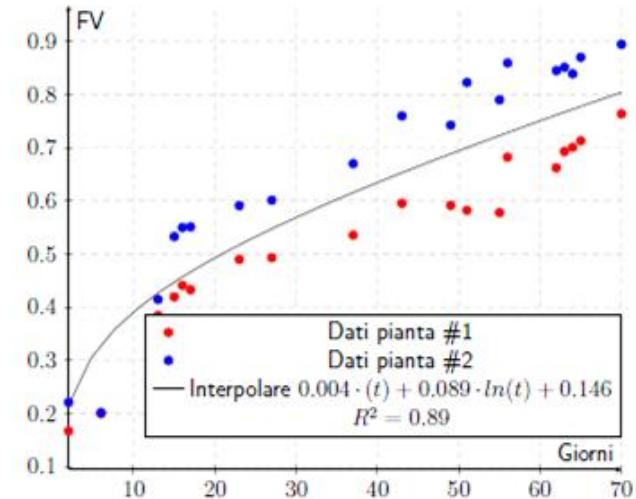

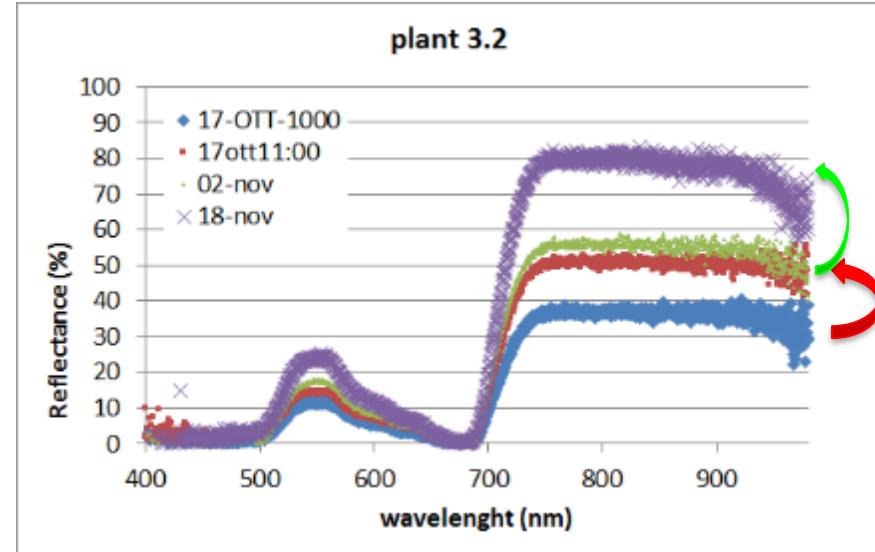

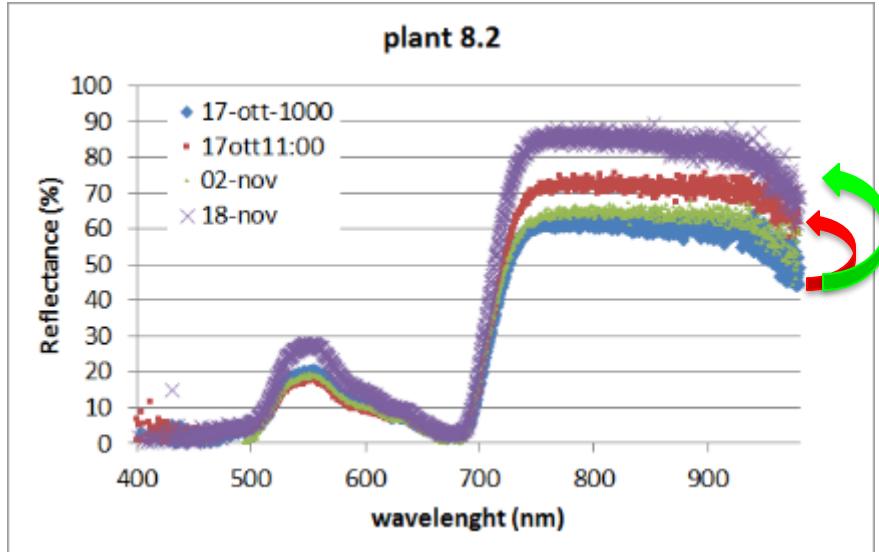

Figura 3.33: Andamento del valore di FV durante l'esperimento

1) Considerable difference in the spectra according to water stress: + VIS, -NIR

	SM		Days from last irrigation
17 october 2016 10:00	0.22	Strees thr	4
17 october 2016 11:00	0.251		1 hour after irrigation
2 november	0.221	Strees thr	5
18 november	0.23		1 day after irrigation

2) Plants are growing:  
Large difference in the green and NIR bands from 17 october to 18 november

## Conclusions ... work in progress

- The instrumented lysimeter allowed to measured the different hydrological fluxes and soil moisture dynamics under different irrigation techniques

18<sup>th</sup> Oct

3<sup>rd</sup> Nov

- Vegetation analysis allows to better define irrigation water needs

- Testing different irrigation volumes according to crop stress thresholds

22<sup>th</sup> Nov

19<sup>th</sup> Dec
