

Precipitation measurement:  
techniques, processes and  
hydrological applications at the  
catchment scale

HS7.1 Co-organized by AS5/NH1/NP3

**A case study of the propagation of  
precipitation measurement biases into  
a distributed hydrological model for  
the Seveso river basin**

# Objectives

The present work addresses the propagation of Precipitation Measurement Biases into hydrological modelling.

## Instrumental bias

## Environmental factor: wind

# Case Study: Seveso river basin (Milan, Italy)

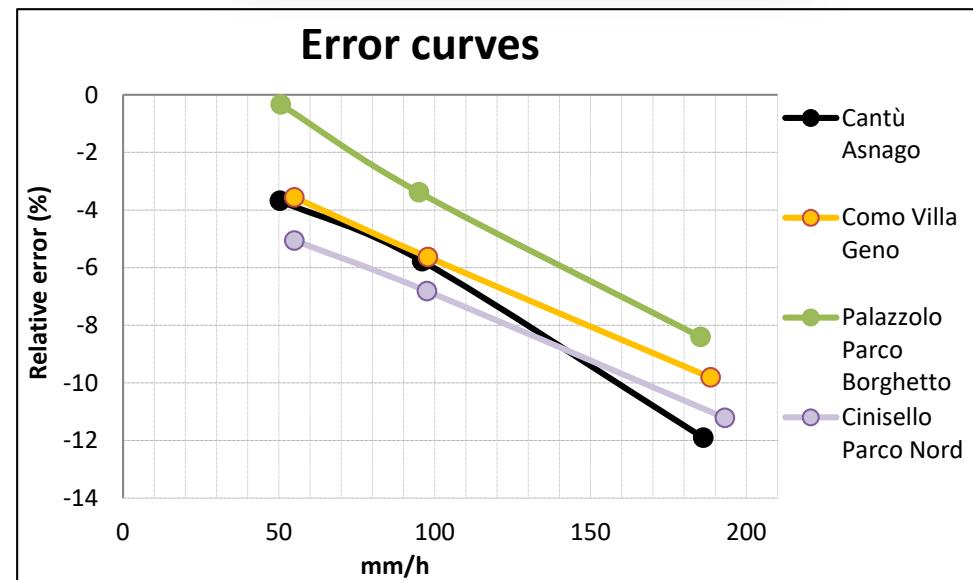

Seveso basin area: 200 km<sup>2</sup>

Available raingauges:  
Como villa Geno  
Cantù  
Cinisello Balsamo  
Paderno Dugnano Palazzolo  
Mariano Comense

Available period: 2015-2018  
Time step: 1 minute

# Assessment of mechanical errors of tipping bucket raingauges

Precipitation intensity:  
50 mm/h  
100 mm/h  
200 mm/h

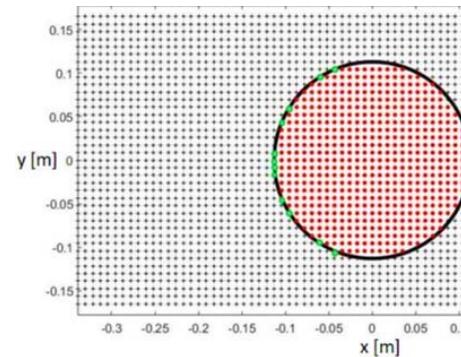

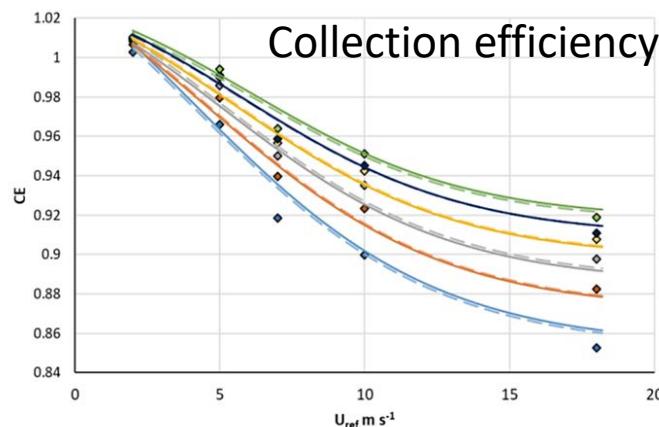

# Wind induced error

Error functions assessed with CFD models

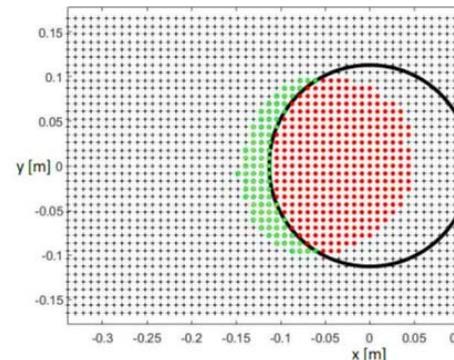

- Rain collector border
- Drops falling into collector
- Drops falling out of collector

Affecting factors:

- Raingage shape
- Wind speed(m/s)
- Precipitation intensity (mm/h)

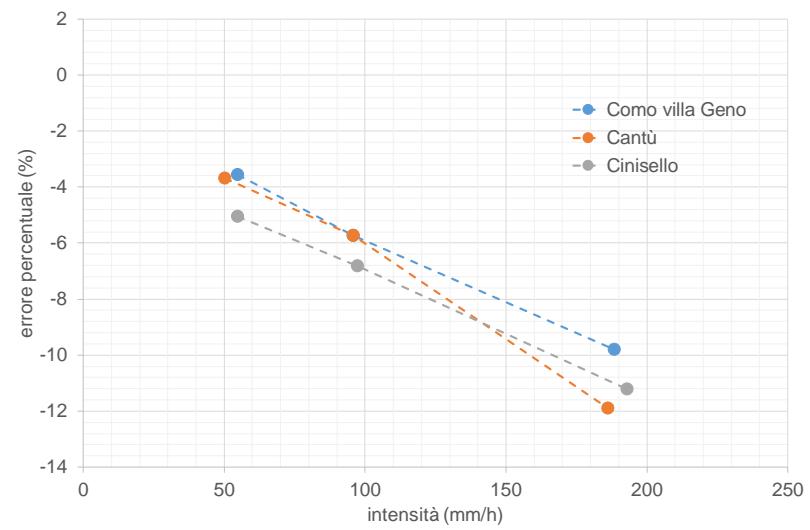

Low wind speed and/or Heavy rain  
→ Overestimation

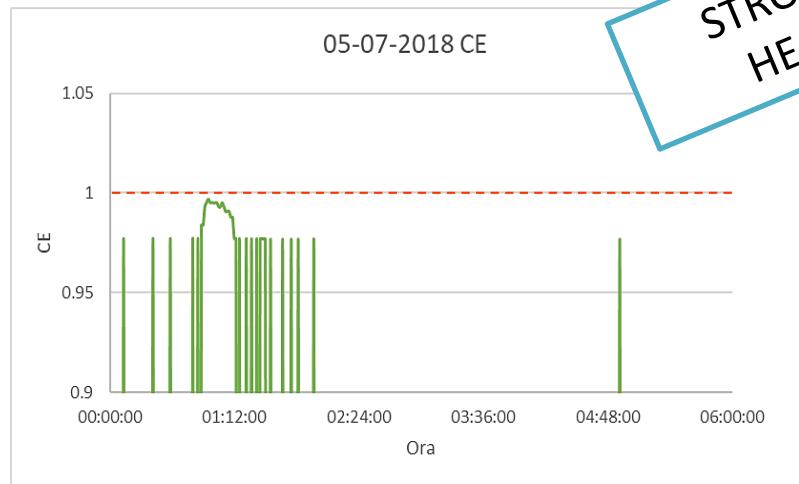

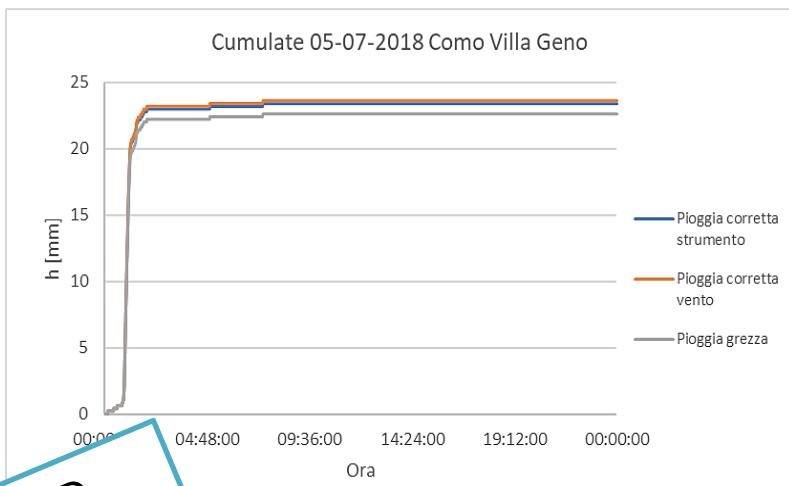

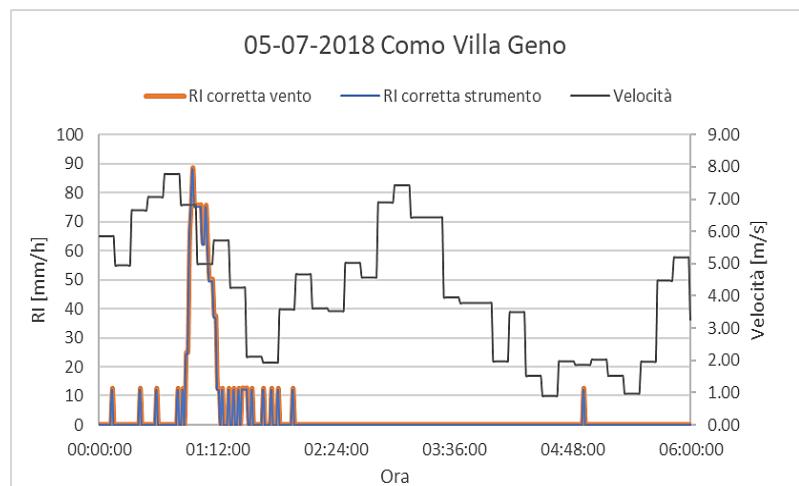

Strong wind and/or light precipitation  
→ Underestimation

# Investigated events

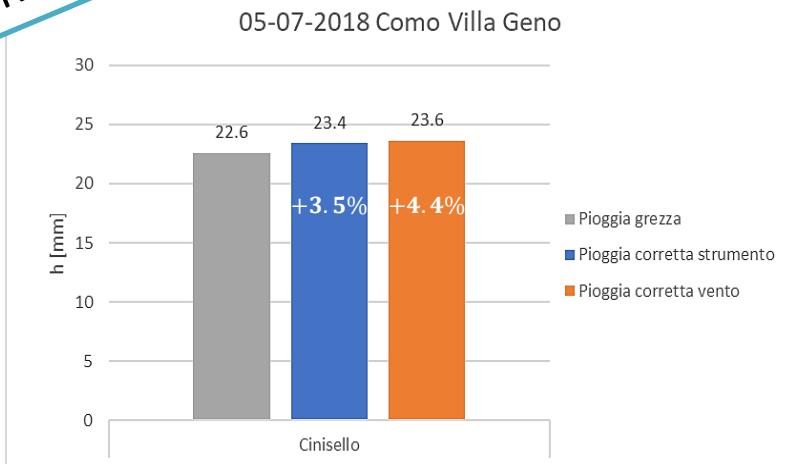

- 1) 11 maggio 2017; convective/frontal
- 2) 28 giugno 2017; convective
- 3) 5 novembre 2017; frontal
- 4) 5 luglio 2018; convective
- 5) 27-29 ottobre 2018. frontal

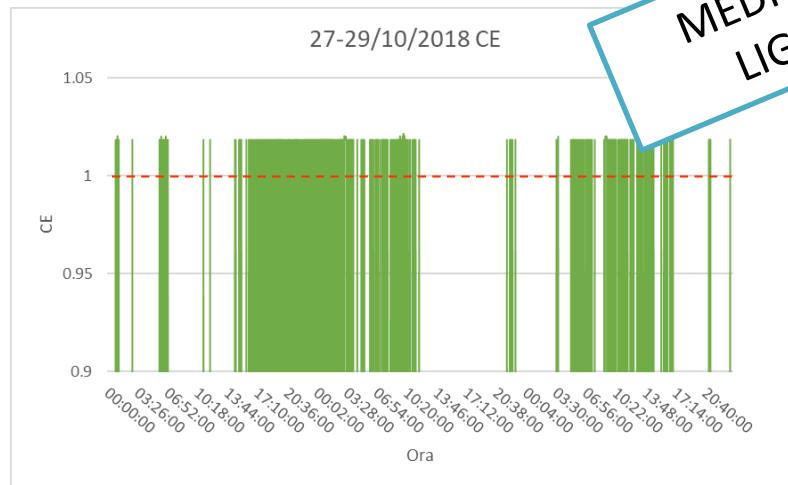

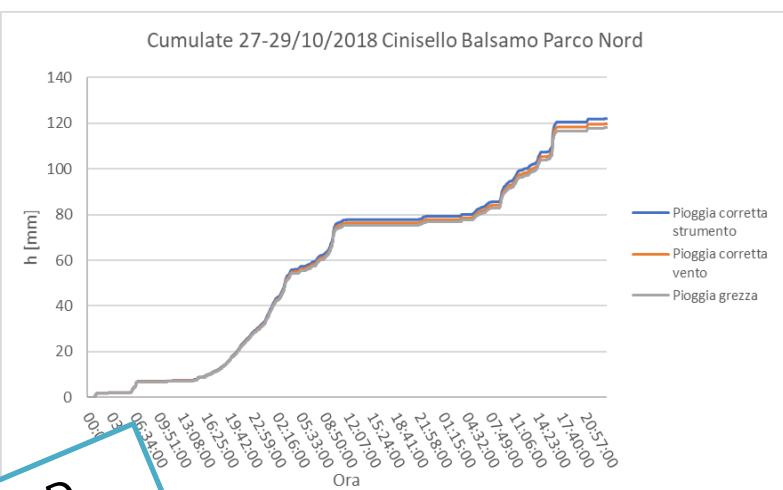

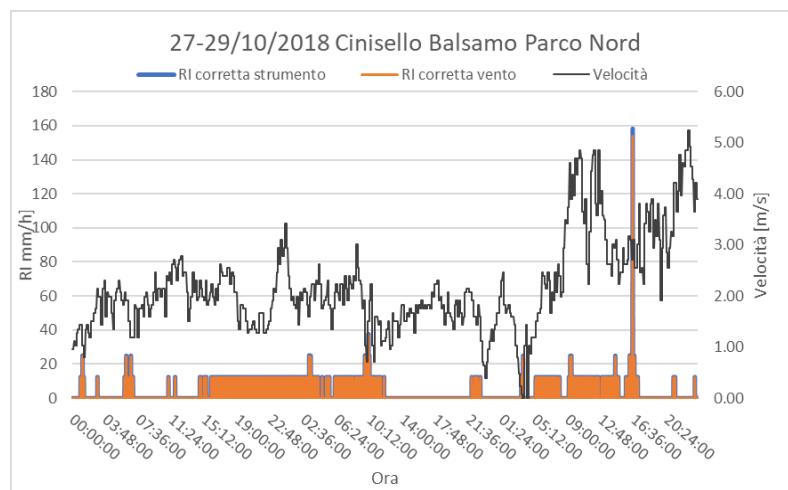

# Cinisello station, event 4 - July 2018

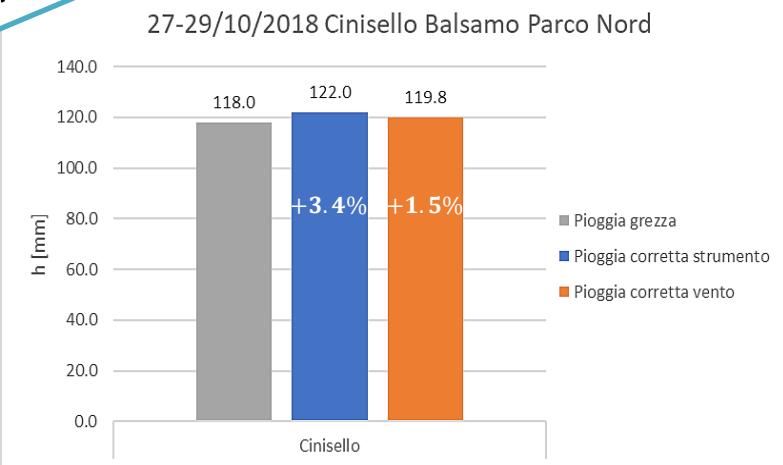

STRONG WIND  
HEAVY RAIN

# Cinisello station, event 5 - October 2018

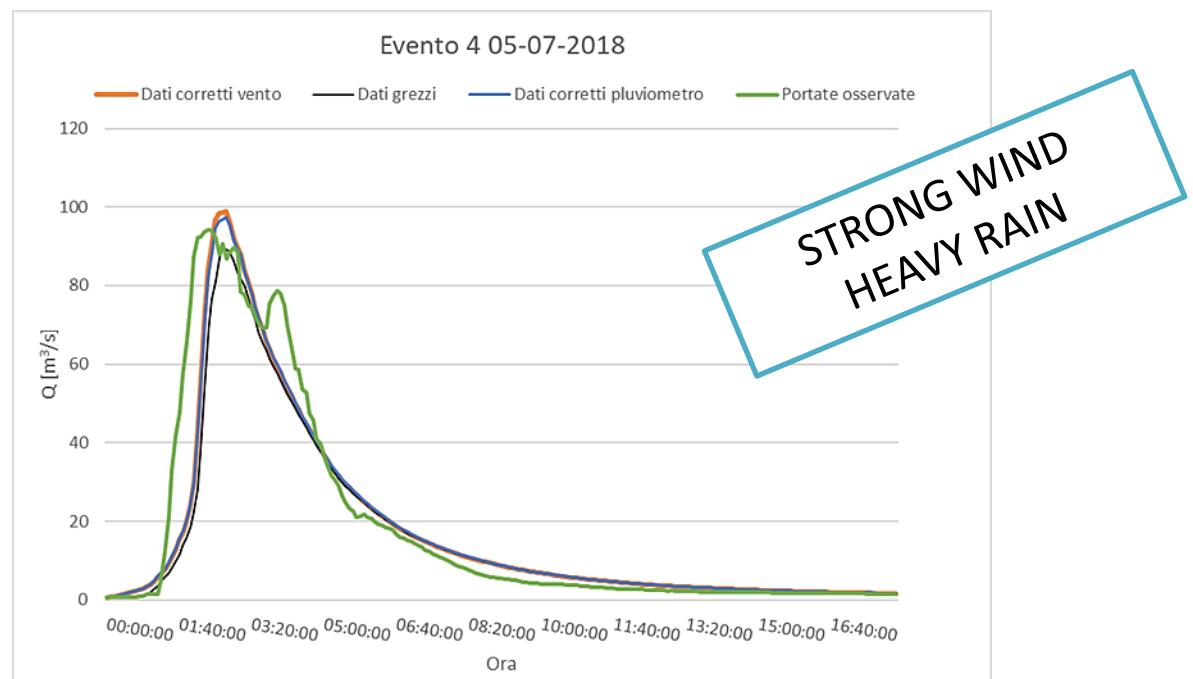

MEDIUM WIND  
LIGHT RAIN

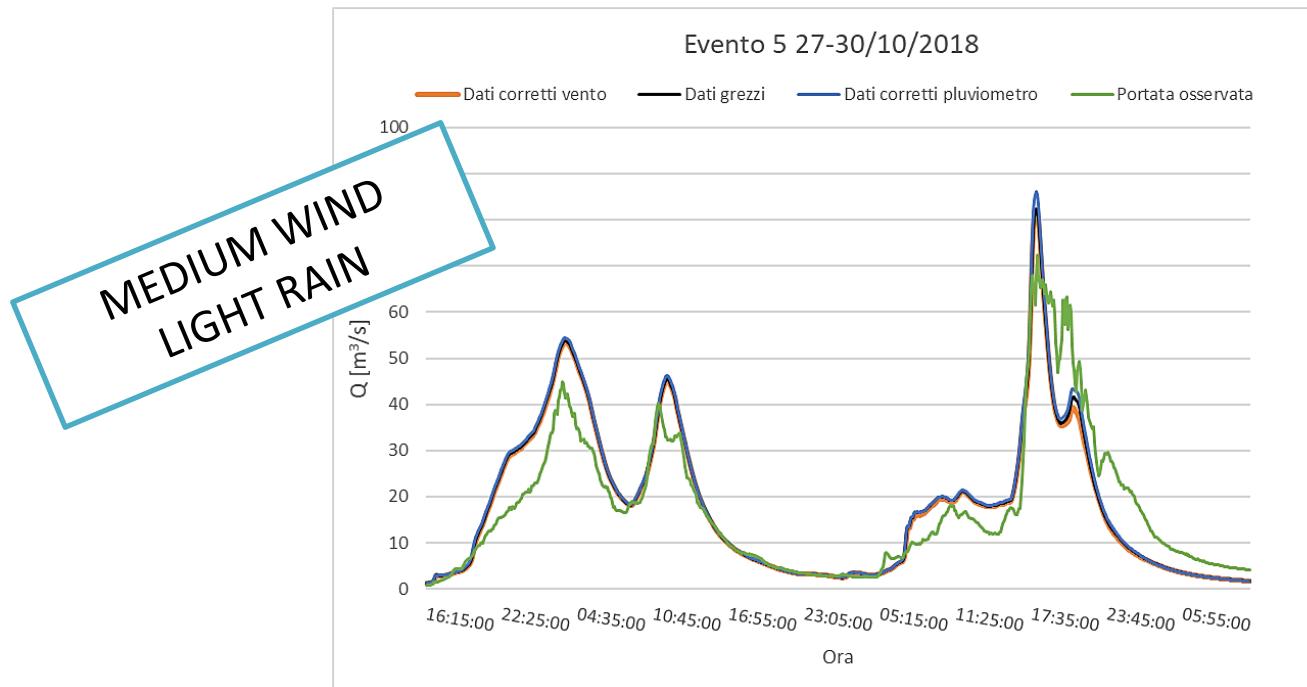

# Discharge, event 4 - July 2018

Q max [m <sup>3</sup> /s]	Uncorrected P	Mechanic error corrected P	Mechanic + Wind corrected P	Observed Q
	89.63	97.44 (+8.71 %)	98.82 (+10.25 %)	57.95

# Discharge, event 5 - October 2018

Q max [m <sup>3</sup> /s]	Uncorrected P	Mechanic error corrected P	Mechanic + Wind corrected P	Observed Q
	82.38	86.09 (+4.50 %)	81.19 (-1.45 %)	72.34

# Overview of flood event simulations

Q max [m <sup>3</sup> /s]	Uncorrected P	Mechanic error corrected P	Mechanic + Wind corrected P	Observed Q
Event 1	71.36	73.98	+3.67 %	71.95
Event 2	65.07	67.91	+4.37 %	63.56
Event 3	61.76	62.50	+1.20 %	61.23
Event 4	89.63	97.44	+8.71 %	98.82
Event 5	82.38	86.09	+4.50 %	81.19

# Conclusions

Tipping bucket mechanical induced error on precipitation < 5 %

Tipping bucket mechanical induced error on discharge modelling < 9 %

Wind induced error in most cases compensates tipping bucket mechanical induced error

When wind speed is strong and rain is heavy the two sources of error sums up leading to error on discharge modelling of about 10 %

# Acknowledgements

This research was funded by Italian Ministry of University and Research within the project “Reconciling precipitation with runoff: the role of understated measurement biases in the modelling of hydrological processes” (<http://www.precipitation-biases.it/>).
