We present the results of the project EKLIMA supported by the Ministry of the Environment of the Czech Republic. The main aim of the project is to create a tutorial model for e-learning courses for lifelong learning focused on climate and its change. The project is thus contributing to increasing the quality and distribution of information connected with environmental protection. Three target groups of inhabitants were defined: students, public officials and the public. The learning model and tutorial courses have been prepared for each of these groups. We present the structure of the course, we report about problems we encountered and we show the results of the first testing phase and feedback from the students.
