

# **Real Time Experiment of seasonal river flow forecast for dam management in France**

---

C.Viel, M. Papazzoni, A.-L. Beaulant,  
F. Besson, J.-M. Soubeyroux and F. Regimbeau

Climate Services and Climatology Department, Météo-France, Toulouse

# Météo-France's prototype in EUPORIAS

- **EUPORIAS (nov. 2012 – jan. 2017)**

Aims at developing and assessing **semi-operational prototypes** of **climate services at seasonal time scale**.

<http://www.euporias.eu/>

<https://twitter.com/euporias>

- **Météo-France prototype** <http://riff.euporias.eu/>

Decision-making tool for dam managers

➔ co-development of products

with EPTB Seine Grands Lacs (**SGL**)

and SMEAG (Garonne)

# Outline

---

- EPTB Seine Grands Lacs (**SGL**): its interest/stake at seasonal timescale
- The technical solution proposed by Météo-France
- The Climate Service development
  - Co-design and evaluation over past situations
  - Real-time experiment

# A decision making process: example of SGL

Reservoir level

$$Q_{out} = Q_{in} + Q_{reservoir}$$

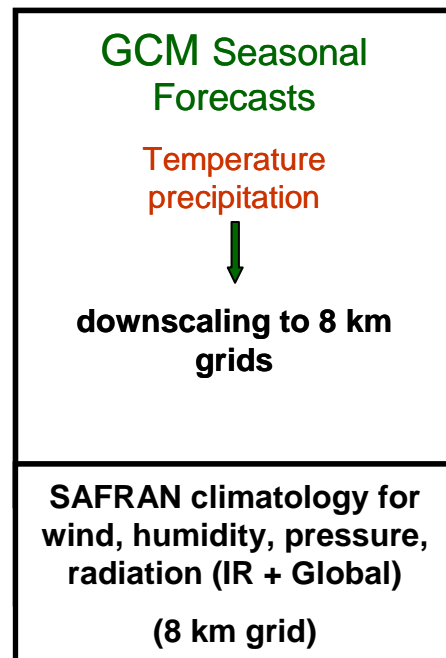

During the dry period : flow release to sustain downstream flow

In May, SGL needs to program the release for the whole dry period

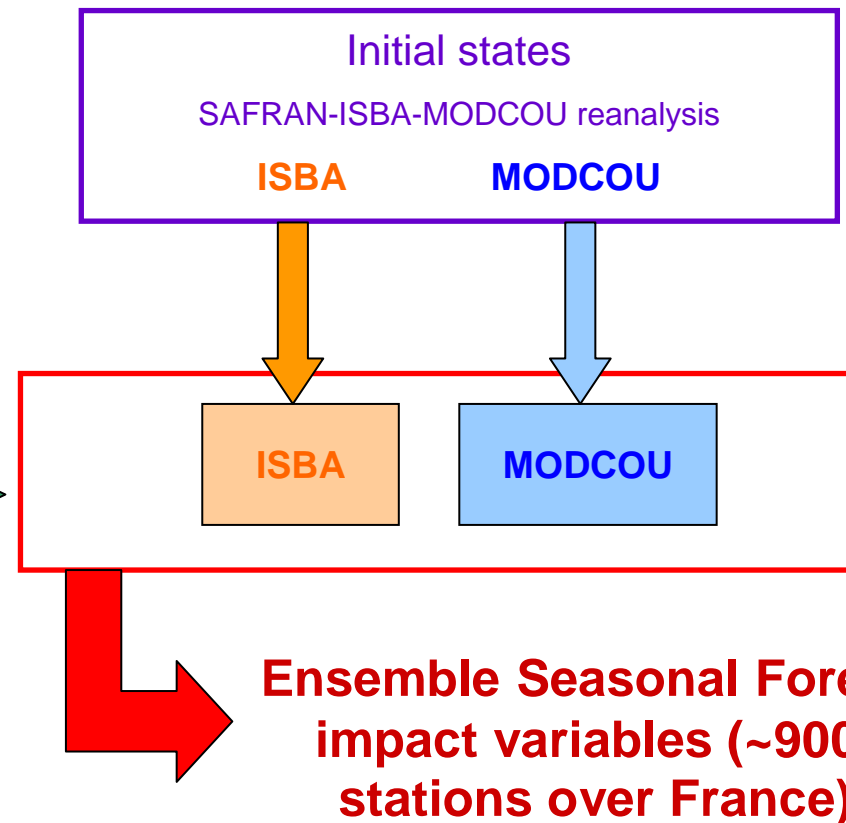

→ This is the decision they want to improve

# Impact prediction system

## Atmospheric forcing

## Impact model (SVAT + River Routing models)

# Prototype development

- **Phase 1 (2012-2015) : co-design and test with SGL**

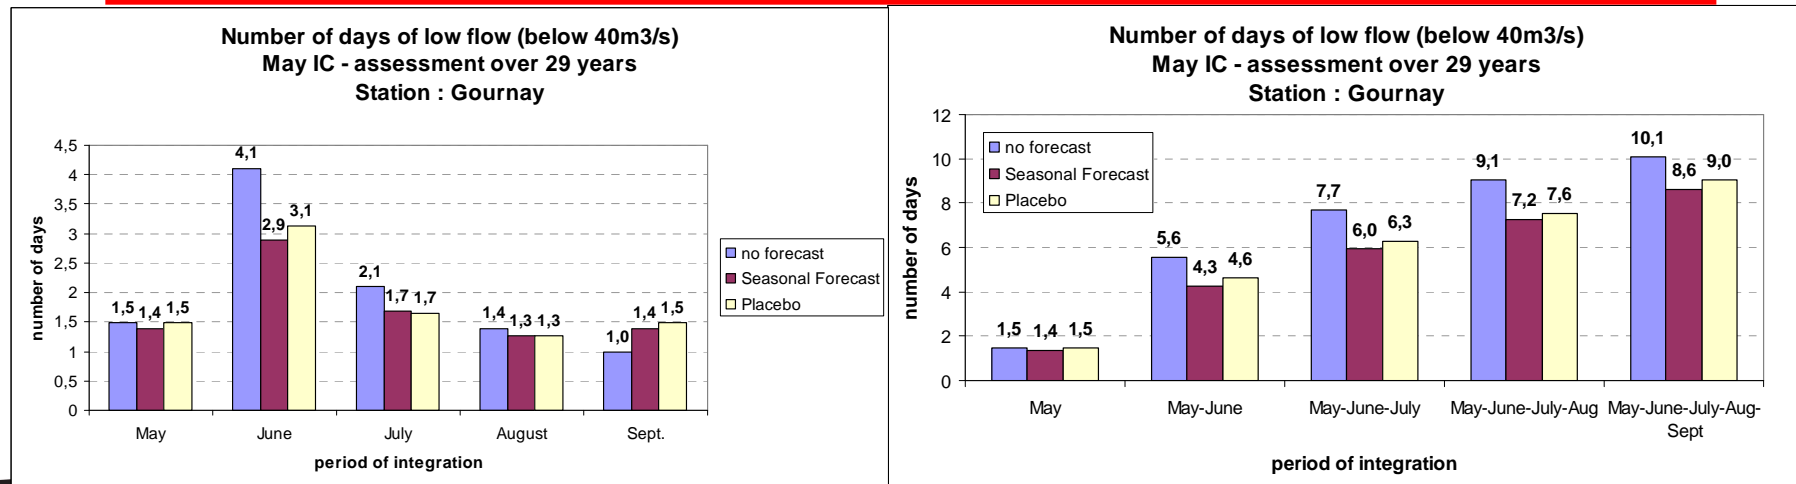

Atm. forcing : - SF (Meteo-France ARPEGE-S3)

- Historical Scenarios (placebo), i.e. same initial states

At Gournay (Seine basin, upstream from Paris) :

- With May IC, little added-value of SF versus placebo

- decisions made with “no forecast” (stakeholder current method) are significantly worse than SF and placebo

# Prototype development

---

- **Phase 2 (2015-2017) : real-time experiment with SGL (and SMEAG)**

Atm. forcing :- SF from MF ARPEGE-**S5 (operational model)**, with a **finer downscaling method**

- historical scenarios, i.e. same initial states (soil moisture, snow cover, river flows...) as the SF experiment, but atmospheric forcing is replaced by a set of past scenarios taken from reanalysis

Impact model : **SURFEX-MODCOU** (**new post-treatment of riverflow**)

Period : **May and June 2016 IC** → forecast May to November

Evolution of forecasting products (co-design) + **new support products**

# Decision support products – 2016 context & forecast

Rapport à la normale de référence 1981-2010 des cumuls mensuels de précipitations agrégées  
Ile-de-France

septembre 2015 à avril 2016

Initial context :

wet soil conditions  
over the Seine basin  
at the end of April  
2016

METEO FRANCE  
Toujours un temps d'avance

EMS 2016 – Trieste 12-16/9/2016

# Decision support products – 2016 flow forecasts

# What happened in summer 2016?

## Exploitation du lac MARNE du 01/09/2015 au 30/09/2016

EUPORIAS

# Conclusion and perspective

---

A long way toward an operational Climate Service :

- Understanding of DMP and user needs
- Development of a Seasonal Forecast integrated chain, with an impact model, post-processed with user's data
- Assessment of the CS value through the DMP ("*does it improve decisions?*")  
➔ taking advantage of the availability of the hindcast period
- Building of a pre-operational CS ➔ real-time experiment

Perspective :

- Business opportunity for economic viability of this CS :
  - identification of new applications/users
  - Integration of this CS onto a broader service dedicated to water management (other variables, other time-scales...)
- Potential technical evolutions of the current forecasting chain :
  - Extension of the prototype to the whole Med. Region : the MEDSCOPE project (ERA4CS)
