

## **Copernicus Climate Change Service - information products for climate communication**

Freja Vamborg

Senior climate scientist, Copernicus Climate Change Service, ECMWF

The Copernicus programme is the European Commission's flagship Earth observation programme, with a space-component delivering data from satellite missions following a free and open data policy, and with a service-component delivering information in six key domains, one of which is climate change. The presentation will focus on the operational service chain of the Copernicus Climate Change Service, demonstrating how data is transformed into information and outreach products of various types and with different target audiences including monthly Climate Update bulletins done in partnership with Euronews.
