## **Making meteorological information accessible: The EUMETNET website redesign journey**

**Alexandra Albus-Moore**

EUMETNET launched its new website in March 2025. The website was redesigned to make complex meteorological information easier to find and use. We faced challenges in organising diverse technical information from many member services into a clear, simple structure. The navigation and programme pages were restructured and renamed to help users quickly access key content without confusion. We worked closely with experts to standardise page formats and improve search functionality. The update also focused on making the site accessible to a wide range of users, from scientists to policymakers. By streamlining the layout, we reduced duplication and improved clarity. The new platform supports better sharing of weather and climate information across Europe. Interactive sessions with our Programme Managers and feedback from our Member NMS helped us create a user-friendly experience. Overall, the redesign makes EUMETNET's resources more open and easier to explore.
