

Sustainable Development Goals: Ideas to fast-track the work of all disciplines towards a future of humankind

Gregor Hagedorn

Our future has never been more threatened. Atomic war was possible, but inaction was enough. Today, we face the prospect of an overpopulated, undernourished, inequitable, resource-depleted (water, minerals, genes), unsustainable world with self-increasing global warming, and wars for survival. Inaction is deadly and we need to move fast, building a sustainable, decarbonized, circular economy.

Researchers of all disciplines need to become active! Information management and research communication is essential for this with most actions discussed on this conference contributing towards this goal.

However: Can we add specific actions? What research is needed most?

Can we prioritize some actions as a result of the requirements of the Sustainable Development Goals? We will a) organize an unconference workshop - please watch the announcement! b) present the collected ideas.
