### **Abstract:**

SANSA Earth Observation's main objective is to ensure that the ultimate value of satellite earth observation enables decision making and policy formulation in areas of national importance such as infrastructure development, agriculture and food security, natural resources management, disaster risk reduction, human capital development and technology advancement towards addressing unemployment, poverty and inequality. Together with other SANSA directorates and in cooperation with other space agencies, we envision a future where SANSA will contribute to make South Africa an international Hub for Space Solutions for the world of the future.
