Stability of ground based measurements of stratospheric ozone

M. Hess and W. Steinbrecht

DWD, FEHPC, Hohenpeissenberg, Germany (michael.hess@dwd.de)

The determination of long term ozone trends demands stability over time of the measurement systems these trends are based on. In this paper, the temporal stability of stratospheric ozone measurements from NDACC lidar and microwave stations is investigated using satellite measurements as a common reference. Especially middle European stations situated close together are used for intercomparison.
